The incubator house should have a window in it for light; also a ventilator in roof to take off hot air. You should also put in a ventilator pipe to carry off foul air; this should be a tin or galvanized iron pipe, extending from about four inches above the floor out of roof. Eggs hatch as well in a light room as a dark one. Earth floor is all right if the location is a dry one, otherwise we would put a floor in it; it can be of wood, or better still, if made of cement. The unevenness of the dirt floor adds to difficulty in keeping machine level, which is essential.

PURE BREEDS.

The farmers who are careless regarding the kinds of fowls to keep pay well for their indifference. They may content themselves with the belief that "one fowl is as good as another," but they are governed by old customs and usages instead of experience. Compared with common fowls the pure breeds are more useful; they lay more eggs; some varieties come to maturity sooner; they are far more quiet generally; at maturity the cockerels make fine birds, and the pullets good winter layers. Flocks of common kinds noticed on some country places cause loss to their owners and are a drawback to any farm in these days of progress and improvement.

It costs but little to begin with pure breeds, and in one year the farmer can have a handsome flock of nice, thrifty, useful breeders that will give satisfaction and pay liberally for their keeping. It is for some reason difficult to overcome the prejudices of farmers against pure bred stock of any kind. Some of them even ridicule those who are progressive, but there would be no progress at all if enterprising men did not seek something better, year after year. Animals that bring high prices for breeding purposes combine utility and good breeding.

There is nothing fancy about them. They are bred for a purpose and for profit, and their owners know what to expect from them.—Inland Poultry.

OLD ROOFS SEEN NO MORE.

How many boys and girls on the farm today have ever seen a clapboard roof? Of course, some have, but a great majority of the young folks never have seen the old-fashioned clapboard roof, while only the old folks have actually made them or seen them made. Mill-made shingles long ago displaced the clapboard.

And now a much better roofing is rapidly displacing shingles. Shingles are costing more every year.

The best and most economical roofing, and siding also, to be had nowadays is "Rex Flintkote." This kind of protection from weather and resistance to fire, made by the old established firm of J. A. & W. Bird & Co., Boston, Mass., has been tested and proved beyond all question. It is a composition of long-fibre woolfelt and waterproof and fire-retarding chemicals. It is easily laid and looks well. The manufacturers will gladly send samples of Rex Flintkote, and a booklet.

Feed the Chicks and Kill the Gophers
West Coast Chick Feed
A full, rightly balanced ration for the little ones, to be fed dry. All pure feed, no filler, no waste. The biggest seller because the best made. Keeps them growing and healthy. For sale by many dealers; if not by yours send direct to us.
Bille's Gopher Poison
Is most attractive to gophers, squirrels, etc., but sure death. Endorsed by Agricultural Colleges and Experiment Stations. Has had the greatest success for years in the Middle West, and also here in California last season. Circular with many testimonials and Affidavit of 201 killed in one day. If your dealer hasn't it, send $2.50 for two bottles, (not less than two) express prepaid by us. Money refunded if not as represented—so printed on the bottle.

WOMEN AND POULTRY.

There is no field open to women today that is less crowded than this, none that offers as good returns for one's labor, none that affords so much freedom when taken as a vocation, and none that makes one so nearly independent of others, says an Inland Poultry writer. Some of our best-planned poultry farms, as well as our best-paying ones, are the outgrowth of women's skill and ingenuity in planning and her financial ability in conducting the enterprise.

Most women show a qualification for neatness about poultry of which men are occasionally void, and as cleanliness is an important factor, she often outstrips our "lords of creation," in results obtained.

The care of poultry is productive of good health to women engaged therein, giving her sufficient exercise in the open air, and just enough of care and responsibility to make her work interesting and to make her feel her importance. This field for women is almost unlimited, and it pays her better profits than she can reasonably expect from most other business ventures.

When all things are considered, there is no agricultural industry known that furnishes so unlimited a field and pays so large a profit on the capital invested, and none that requires so little labor as the poultry industry.

SUGGESTIONS FOR PRESENT DUTIES.

Many poultrymen have now finished hatching operations for the season and are desirous of keeping the chicks in a healthy growing condition. The writer has kept poultry for nineteen years or more and in his contributions to the poultry press has sought to be practical rather than theoretical. He has learned by dear experience that success in the poultry business depends upon strict attention to details and a readiness to do the right thing at the right time, says a writer in Successful Poultry Journal.

The successful poultry raiser does his best to protect his flock from enemies. He must wage a persistent and relentless war against all their foes. It is perhaps almost needless to say that the most deadly foes of poultry are lice and that it is in the summer months that they do their deadliest work. Small chicks should be frequently and carefully examined to see if they are free from insect pests. Head lice are especially destructive to small chicks and are rather difficult to see, but their presence may be easily discovered if one wets the tip of his fingers in kerosene and lightly rubs it over the head and throat of the chick. If head lice are there they immediately loosen their hold and prepare to retreat. A very slight (and it must be slight) moistening of the head and throat of the chicks with kerosene oil in which moth balls or naphtha flakes have been disolved will relieve the chicks of these pests, or one may use some of the lice ointments sold for this purpose. If there are body lice upon the chicks they can usually be found under the wings and around the vent and one large variety prefer to remain on the feathers of the neck. All species of body lice are killed by dusting with some good insect powder. The coops and houses should frequently be examined for red spider lice and sprinkled with the kerosene and naphtha flake solution or some

commercial lice killer. We like once a year to whitewash all coops with whitewash in which has been stirred a little chloride of lime or crude carbolic acid which makes the whitewash a better disinfectant and more destructive to insect life. One cannot raise fine chicks and allow them to be infested with lice. Coops and houses must be kept reasonably clean and some arrangement should be devised to keep them well ventilated and prevent them from being overcrowded.

My bill of fare for little chicks is bread and cracker crumbs, rolled oats and a chick feed composed of a variety of fine cut grain. After they are three or four weeks old they are fed wheat and cracked corn and then oats as soon as they are large enough to eat them. Sometimes we feed barley instead of oats. When small they are occasionally fed beef scraps and as they grow older they are usually allowed access to all the beef scrap, oyster shell and grit they care to eat. We used to feed one meal a day of mash during the summer to old fowls and chicks but recently have quit feeding mash during the summer months. The writer's chicks have generally had grass range but when that has not been possible they have been supplied with lawn clippings, lettuce, cabbage, Swiss chard, clover or some other kind of green food. We grow the largest breed of fowls and manage to make them average over Standard weight, and have had Light Brahma cockerels that weighed 13 pounds before they were one year old and pullets that weighed 11 pounds and over when sent to the winter shows. This has been accomplished by breeding for size and keeping the chicks growing. With some varieties of fowls it is best to separate the sexes when the chicks are about half grown in order to prevent the cockerels from worrying the pullets. Brahmas of both sexes have often been allowed to run together until nearly mature but our Light Brahma Bantam cockerels have to be put by themselves when about four months old and we have found that fowls of the Mediterranean and American classes need about the same kind of treatment.

SMALL GRADERS POPULAR.

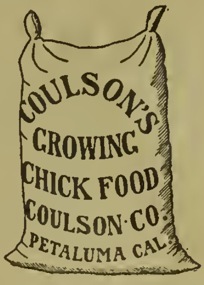
The day has surely dawned when the demand for the small grading machine must grow rapidly. All over the United States there is springing up an insistent demand for something which will take place (in 75 per cent of the cases) of the large, heavy graders. The big machines demand a large investment and the use of several men and from six to eight horses.

When a machine like the 20th Century Grader made by the Baker Manufacturing Co., Chicago, Ill., is put in competition with the big machines, road officials, highway commissioners, irrigation farmers, railroad builders and others find that the cost of operation is very materially reduced.

The 20th Century Grader weighs only 600 pounds, is made entirely of malleable iron and steel. It requires usually only two horses. In a few cases four horses will be needed. One man can handle it.

The Baker Manufacturing Co., have just issued a handsome free booklet in orange and black entitled, "20th Century Highways." This book describes up-to-date methods in road making, gives bona fide communications from recent users and letters from all classes of officials. It has an insert in the center giving a large half-tone view showing every part of the grader. This cut is eight inches long.

Every man who is interested in grading of any nature, whether road men, irrigation farmers, send for this brand new booklet fresh from the press.



Coulson's
Growing Chick Food

After hatching your chickens and raising them successfully up to 5 or 6 weeks old, they are worth something to you, and every one that dies now is a distinct loss in the cost of feed you have used, as well as the cost of hatching and subsequent care of them.

Therefore, in deciding what feed to use now that they are getting too large for the baby chick food, you must exercise the same care as before, to give them the best.

The Best Feed with the Least Labor

Is what you want and that is where

Coulson's Growing Chick Food

comes in.

Coulson's Growing Chick Food is rich in protein, owing to the meat and bone it contains. The grains and seeds in this food are not all ground up, a portion being granulated, so as to give their digestive organs sufficient work to insure health. The food contains a large variety of ingredients, which furnish the growing chick all it requires for quick, healthy development.

COULSON'S GROWING CHICK FOOD is especially adapted for feeding dry in hoppers, as well as dampening as a mash.

THE HOPPER STYLE OF FEEDING HAS NUMEROUS ADVANTAGES:

COULSON'S GROWING CHICK FOOD can be placed in a hopper in sufficient quantity to last for several days. If this hopper is properly constructed there will be no waste, and the consequent saving of labor in feeding is large. The chickens thrive amazingly well on it, and are kept in the most healthy condition, as with the dry feed always with them, they have no desire to gorge, with consequent digestion troubles.

Many have hesitated about trying this method of feeding by reason of the cost of the hoppers required. A good hopper for dry feeding can be made by any one at a very slight expense. We will be pleased to furnish a simple method of making these hoppers, free of charge to you.

Try the Dry Feed Method

with

Coulson's Growing Chick Food

and we are sure you will never use any other.

COULSON'S GROWING CHICK FOOD can be used for chicks from 4 to 6 weeks old up to 3 months old, when COULSON'S EGG FOOD or IMPROVED MASH EGG FOOD should be fed them.

If your dealer does not handle COULSON'S GROWING CHICK FOOD, write to us and we will tell you where you can get it.

Starbuck's Barred Plymouth Rocks

We trap nest our hens. Why set from poor layers? Bird laying qualities are
Inherited the same as any other. This year we have discarded all old matings
and have gone to the next generation. Cocks have 9 generations of 200 egg
mothers. Hens all from 200 egg mothers and from cock with 6 generations of
200 egg mothers, and are layingfine. We have divided into pens according to
the way they are showing up in six months laying. $2.50 for 13 eggs from first
pen. $1.00 from 2nd. until they have time to make longer records. (Except
from our one best, not for sale. We claim the world's Barred Rock, 6 months
laying record for this one.) Do you wish to hear about our prize winning Buff
Orpingtons and Silver Wyandottes? We have something to crow about. No
Sunday sales or visitors. Wm. Starbuck & Son. Fullerton

Live Stock and Dair

THE DAIRY TRAINING.

NOT for the cow alone, but for both man and cow this training is needed, if the best results are to be secured. In California the dairy owners do not often attempt to do their own work; if they take any actual part in the work, it is not the milking. That is left to the hired milkers. The milkers employed around this neighborhood are Portuguese, Swiss or some other dark race; my men for years were "Moors" from the islands off Spain. The dairy in California does not, therefore, mean a small place worked by the family. Rather it means larger resources and a liberal income. The milkers employed as a class represent the best men on the ranch, they are steady, hard-working fellows and give less trouble than other help. I think, perhaps, it is because they do one thing only. The multiplicity of duties makes men of limited mentality less ready at the work in hand. I often wish the other departments of ranch labor could be filled with as good men as the milkers .

Training.

Rarely is the ranch foreman fitted to guide the men to the best advantage in their work. The lesson for the dairy farm is prompt work and on time! The fruit and general farmer often has no idea of what can be done in a given time when he begins his work, no schedule of work planned. The item of time enters into ranch work intimately. The work should be mapped out and so many weeks allotted to each portion, then if at the end of any week the work has fallen behind, but on more men and more teams and pick it up and push until you are a week ahead of time. The seasons will not wait and in our contract with Nature the legal term, "Time is the essence of this contract," stands out plainly.

Nature will not accept any legal quibbles to help you escape the penalty. Time can be made by not trying to do more than can be well done with the tools, time and money at our disposal. Intensify rather than diffuse your efforts. Learn to eliminate the unimportant and do the essential before putting on frills.

The application of this to the dairy? Now is the time to push the planting of corn and sorghum crops, and to plant plenty of pumpkins and do it quickly. The idea of buying anything you can grow yourself should shock you severely. It should send cold shivers down your spine. This is profitable farming.

Breeding.

The dairyman can, in a few short weeks, acquire a whole education from the government bulletins on the topic of feeding. When you secure a new idea put it to work at once. Don't salt it down for next year. You will never have more time than you have today. These government bulletins are sent for the asking, and only for a few is there a nominal charge made of five or ten cents. After reading on the subject, probably the first actions will be the introduction of new improved blood. The purchase of a well bred sire and raising of the heifer from the cross. This is the cheapest way to improve the breeding of the herd. A registered cow will give in her life of fourteen years, probably not over twelve calves and if six of these are heifers we have about the full increase. While the si e easily give fifty calves a year, f are heifers that makes twent year or three times and half a in one year as the registered c duced in her life time.

Culling.

The original cows were pro t all types and classes; now aft are culled out there will be a ce per cent of the offspring that are even in the third and fourth ge tion. These cows are dried off sold to the butcher, usually bring sufficient for beef to mee cost of raising them, for they young and fat when sold. The ference between a fancy bred cow and the ordinary run of co very marked. Prof. H. H. De Ontario writes as follows on point. "We have in our stable stein which has produced 2522 of milk in 30 days, within 500 of the average annual produ cows of Ontario and Qu seven days she gave us 643 po milk. If we had cows like tha would be no trouble about plenty of milk to drink. A man not afford to keep cows that pr only 3000 pounds of milk in a y

Feeding.

While the new blood introd c these grade heifers will increa production of the cow, we in must expect to increase the used. At least, we must inc the digestible contents. Whil cheaper mother cow gave milk t full capacity on straw alone be her milk capacity was not abov available nutriment in her feed. the same as though we have a engine that occupies a space many feet; that is, say, te power, now we move it and put twenty-horse power that occup same space. We can put a lo that amount to be driven by the engine or double the ar the first engine could move. when the larger engine starts off the gang plows we at once fin while we have added at least d the number of plows to its loa are also burning much more oil the work, The graded up heife the same increased capacity i body that the larger engine ha we must feed her, i.e., furnis much more fuel if we woul out the full capacity of the cow feeding of animals must bear tive proportion to their weight.

Rations.

Wolff of Germany was the call attention to the great wa feeding cows. That often wa knowledge of the proper proport foods, an expensive article of could be replaced with a cheap and fully as good results be ob Taking as a unit the weight living animal at 1000 pounds, Wolff figures that dry matt pounds in weight, protein 2.5 hydrates 12.5 and fat 0.6 as a dai quirement. Then it was consi that a larger cow should have and a smaller one less. The cal feeder soon found out that production rather than bodily w that governed the amount of f cow could profitably handle. Some could do well on more concent food than others. The balance tion, therefore, is to be used indicator rather than a fixed While it would be impossible to

each cow in the dairy and then feed her exactly to the pound the ration on which she produced the best, we can come at it in another way. The other road is along the lines of breeding the cows alike. A herd that is of one breed is, therefore, more economic to feed than one that is of mixed breeding. The man, therefore, that raised his own heifers has less of a feeding problem than one that buys his cows from a drover.

Water.

I believe that the milk production of the ordinary family cow is greatly curtailed by lack of water. I have watched the cows drinking and find that fully half of them do not take a drink until after they have eaten, none drink enough to be free from thirst later than nine o'clock. When a cow is watered at milking time, then at noon and at night she probably does not drink more than half of the amount she would if given free access to water all day long. Comfort and cleanliness go next in making the cows happy. A happy, frisking herd of cows is a joyful sight, one knows they are well contented when they put their tails up over their backs and run and try to kick up their clumsy heels. It is amusing to see how they resented the first time the auto ran by the pasture, everyone chased after it along the fence as hard as they could go and stood lowing as it went out of sight. These cows were comfortable or they would not have cared what went along the lane.—M. E. Sherman.

BREAK OFF THE BOAR'S TUSKS.

A boar is provided by nature with very good weapons which he uses with fatal effect ofttimes both upon man and beast. These weapons are the four large tusks, one upon each side of each jaw. These are very sharp, and their growth is rapid, often three or four inches in a year. These tusks are not at all necessary to either the life or health of the boar, and it is a great deal safer for all concerned to keep them short; particularly at this season of the year, when the breeding is nearly over, does the boar become unruly, and this is a good time, therefore, to break off his tusks.

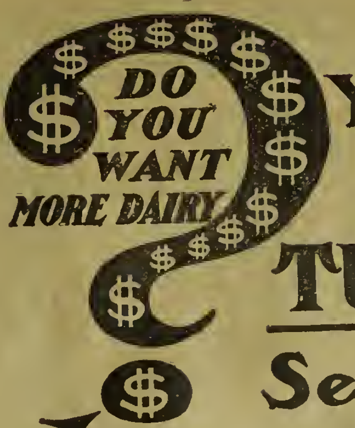
If he is not ugly, this may be done while he is serving a sow, by simply clinching them in pinchers and bearing downward and outward, or upward and outward upon them as the case may be. The tusks are very hard and brittle and break easily.

If the boar is vicious it is best to put a slip noose over his nose, back him into a corner and fasten the rope to a post, or anything of the sort that may be near at hand. Then while one man holds his nose up by means of the rope, at the same time pressing against the animal with his knee to keep him where he belongs, the other snaps off the tusks.

If the breaking of the tusks is attended to every six months, as it should be, much less injury to man and beast will result.

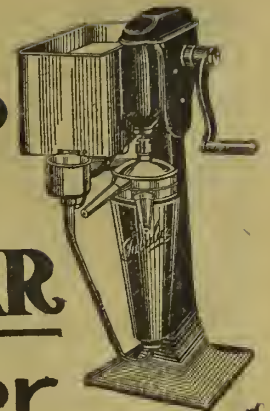
A cow has an affection which she will usually give to the one most attentive to her. She will give her milk to this one better than to anyone else, and to secure the best results he should milk her regularly.

It has been discovered that farms near Elgin produce twice as much as farms in other parts of Illinois. This simply proves the old statement that dairying increases the fertility of the soil.



DO YOU WANT MORE DAIRY $

THEN YOU NEED A TUBULAR Separator



The answer to the question is in no doubt.

Everybody does.

The way to have more Dairy Dollars is to get a Tubular Cream Separator.

The reason for this answer, and the proof of its truth, are in the experience of Tubular users.

Dairymen and dairywomen everywhere have been gaining good Dairy Dollars with the Tubular. Some had no separators before buying Tubulars, others had some other make. ALL gained, however, in money, or saving of work or both, when the Tubulars were put in—they get more Dairy Dollars.

Making Twice as Much
NORTH BUENA VISTA, IOWA,
Feb. 8, 1908.

Before we bought the Tubular we had a——. Did not like it. We are now making just twice the amount of money we did before KARL KOCH.

One-Third More Butter—Less Work
MANSFIELD, OHIO,
Jan. 13, 1908.

Bought one of your Tubular separators last August. We make one-third more butter than by hand skimming, and no crocks to wash.
MRS. GEORGE HENRY.

The average gain, from average cows, with a Tubular separator is one pound per week, per cow, compared with raising cream systems.

Are you interested in this sort of gain of Dairy Dollars? Wouldn't you like the success that is shown in above letters? Don't you want a pound of butter more, per week, per cow, than you are getting from pans? Don't you want butter gain and less work, if you have a separator?

Write for Tubular Catalog No. 260 illustrated explanation of why the Tubular does better than other separators, how it is different, easier to operate and clean, scientific and mechanical reasons for Tubular superiority, and some testimonials from Tubular users.

BIG BUTTER CONTEST
National Buttermakers' Association
WON AS USUAL BY USERS OF
DE LAVAL
CREAM SEPARATORS

On March 11th, 12th and 13th there was held at Minneapolis, Minn., the big annual butter scoring contest of the National Buttermakers' Association. 504 of the best buttermakers in the United States competed in this contest, which makes the results especially interesting and important. The first prize was won by J. C. Post, Hector, Minn., with a score of 98 per cent; the second prize by E. O. Blomquist, Center City, Minn., with a score of 97½ per cent, and the third prize by G. P. Sauer, East Troy, Wis., with a score of 97 per cent. All three of these victorious buttermakers, of course, use De Laval cream separators. This contest, as has every similar contest held within the past sixteen years, shows a complete victory for butter made from De Laval separator cream. A clean sweep of all highest prizes was made by De Laval butter at the big National Dairy Show held in Chicago last October, as well as at sixteen of the more important State fairs of 1907. Going further back, De Laval made butter received the Grand Prize at the St. Louis World's Fair, as well as the Grand Prize at the Paris Exposition. Invariably in these big contests more than 90 per cent of the contestants who receive a score of over 90 per cent on their butter have been found to be De Laval users. In hundreds of such contests the world over during the past twenty years, the superiority of the De Laval Separators over all others for making fine butter has been conclusively proven. A postal card will bring our handsome new catalogue illustrating and describing the new 1908 improved De Laval machines in detail, and affording a complete education in the production of the finest quality cream for making prize winning butter.

MULE-FOOT HOGS.

These hogs were guaranteed to me to be cholera proof, and after subjecting them to the most rigid tests, I have no grounds on which to dispute the statement.

Through the department of agriculture, at Washington, D. C., we learned that they were bred in the west. By correspondence with our Western friends, we learn that their origin is practically unknown and they say after a careful search of several years they fail to find the South Sea Islands, or any other islands or country whose history gives any account of the Mule Foot hog, except one writer who claims they were brought to this country in 1637 by the Swedes and landed on the coast, now the State of Delaware. The author of the Ozart hog claims they originated from the Texas Peccary. The Pecarry has a split hoof; the North American wild boar has a split hoof, and every specie of known swine has a split hoof except the Mule Foots; therefore, we claim their origin unknown.

It would be very gratifying for me as a breeder of Mule Foot hogs to be able to say to the inquiring public that their origin was thus and so.

It has been my pleasure to see a bunch of hogs the sire of which was Mule Foot, crossed on Durocs, Chester Whites and Poland-China, some of which were full bloods, and I find from 75 to 90 per cent were Mule Foots. From Chester Whites they were white and black; from Durocs red and black, and from Poland-Chinas almost solid black, but all had great length and large bone; strong resistance against disease, strong breeders and good feeders, fattening at any age, is the record made and sustained by the Mule Foot hog.

Description—In its general makeup it resembles the Poland-China, though attaining greater length. The best specimens fully as mellow, lacking only in width and shortness of legs. In color black. In the central and western States some white is permissible; they are better in bone and will carry more weight without breaking down in the foot than the average of other breeds. They are kind and gentle, good mothers, and are very prolific.—George W. De Hart, president Mule Foot Hog Record Association.

Clean milk comes from clean cows. Milk is kept clean only in clean vessels. Cows and vessels are kept

The best profit in dairying comes from the manufacture of strictly first-class butter for private customers.

If the cream is a few degrees too warm or if the churn is not stopped at just the right time the grains of the butter may be seriously impaired.—

According to Henry, a sucking calf should gain three pounds per day for the first month, two and a half pounds per day for the second month and two pounds per day for the third month.

op the Loss in Irrigation

Written especially for the California Cultivator.

E. O. THOMASON, COVINA.

YONE must be impressed the vastness of the arid s of the west. There are in d States 550,000,000 acres of ds. Blessed with soil and hese arid valleys lie in re- iting the day of, a people nius shall break their bands gy and awaken them into ctivity.

on, directed by scientific s and upheld by modern me- knowledge, will afford the en to us this new and untold vealth.

owledge of irrigation and its has not originated in our has been known from the period of antiquity. Irriga- practiced by ancient dwell- ne Ganges, the rivers of d the Nile. Irrigation was o the soil on the banks of the motely as the days of Virgil. ural overflow of the Nile and dant benefits was doubtless he first object lessons, and suggested to the ancients ficial overflow would also be l to their crops.

Development is Modern.

val races, however, lacked information, nor were they by mechanical inventions to p the clue afforded them by mitive knowledge of irriga- rigation, therefore, as an ex- nce, must be considered mod- fullest development can be ished only with the use of s and mechanisms of modern n recent knowledge.

n science gives great advanc- the cause of irrigation in sup- he knowledge of material so as concrete and so infinitely as the same when "rein- Modern invention supplies ep-well" pump, and affords ower for its operation. With litions of our time, it may as- be predicted that the immed- re will witness great achieve- n irrigation development.

nes of Development.

developments will be made two important lines. First: elopment and conservation of supplies. Second: The con- n of conduits capable of carry- er with minimum loss.

irst line of development is in- able in importance. To the ienced observer, the import- the second is possibly less ap- and, therefore, merits our care- sideration. To obtain the full- efit from water supplies, the wasteful ditches should be dis- d And such ditches should aced by conduits which will loss of water, from seepage aporation.

Drop Needed.

irrigable lands where "Water and where the most abund- s are possible with irrigation, efi to be obtained are in pro- to the amount of water judi- applied, and every drop of needed by crops but wasted by tion or seepage from ditches, a positive and direct loss of and money.

n the seepage from large canals becomes a menace to orchard ld, not infrequently taking the of a body of surface water l upon or too near the surface land.

Losses.

give an idea, obtained from act- its, of the serious loss of water g in earth ditches, we quote the sion of M. G. Carpenter profess- ivil and irrigation engineering of ado Agricultural College, Bulle- . 45: "With ditches in heavy here was usually a loss equal to th of three inches over the canal each day. In sandy soils some degree of clay the loss be two feet a day, and in some where there was gravel bottom ss became many times greater. f the old canals in the suburbs of y was found to loose at the rate enty-seven feet in one day."

aking of loss of water by seep- nd evaporation, Samuel Fortier, an experienced engineer writing in the Irrigation Age recently stated that "of the millions of dollars annually expended by our irrigation districts for water and for applying it to cultivation crops, fully seventy per cent of the money is wasted."

Evaporation is Great.

An atmosphere dry and heated, such as will be found in summer in arid and semi-arid regions, offers great facility to evaporation. Water running in an open conduit will waste by evaporation at a surprising rate.

In the summer of 1899 the writer with his family was camping in the mountains in Southern California, by the side of a small stream of water. There were perhaps twenty-five inches of water. This stream ceased absolutely to flow each morning about ten o'clock, but resumed its flowing in the cool of the evening or about sundown. This cessation of flow was found to be due to evaporation, which was sufficient by ten o'clock to take up the entire stream. By sundown the evaporation was so arrested that the stream resumed its normal flow.

Having had a number of years of experience in irrigation in Southern California, we have often noticed the increased night-flow of our irrigating streams due to arrested evaporation at night. It is a fact, also, that all of our fountain streams rise very appreciably, in the cooler autumn months even without rainfall.

One of the authorities quoted above states that, as a rule, cultivated fields do not receive more than 66 gallons out of every 100 gallons of water which pass through the upper head gates, the rest being lost by seepage and evaporation. Attempts have been made to prevent loss of water from irrigating ditches by lining them with clay, road oil or concrete. These attempts have been attended with more or less favorable results only as to seepage, the loss as to evaporation, however, remaining undiminished.

Materials.

Prevention of loss of water from these two causes is being accomplished by the employment of some form of pipe conduits. The materials which now offer themselves for use in the construction of these conduits are wood, clay and concrete. Owing to the presence nearly everywhere of sand and gravel, which forms the greater bulk in the makeup of cement (or concrete,) this latter material is considerably cheaper. Concrete is the only material which grows better with age. This material has been used in Southern California for about 20 years and shows improvement rather than signs of decay.

The Azusa Irrigating District furnishes a splendid example of the husbanding of water supply by a pipe system. This company, located in Los Angeles county, owns 4000 acres of orchard and garden lands. Prior to 1893 it had earth ditches cut through clay, gravel and sandy soils. The end of the district farthest from the water supply, made little attempt at orchard planting, owing to the fact that at the time of low water the supply would scarcely reach that end of the district. In 1893-4 a splendid system of cement pipe lines, with a few miles of vitrified or clay pipe, was constructed at a cost of two hundred thousand dollars.

Saved Orchards.

In the dry seasons that immediately succeeded that time, the system was worth directly to this district all that it had cost. It was the means of saving valuable orchards that would doubtless have dried up but for the pipe lines. Since this system has been in operation, this entire area has been kept in a high state of cultivation, there being the utmost assurance amongst the owners that water will be flowing.

Other irrigation districts have had like experience. An irrigation district newly formed should install the pipe system. This is especially true if the water is limited or if it is an expensive supply, such as is obtained by pumping. A pipe system is the only system that will deliver all the water to the land at remote parts of the district.

EASTER CHIMES.

"The Lord is in His holy temple," steals
Through vaulted arch and nave and chancel dim,
And loud the swelling answering anthem peals
"Let all the earth keep silence before Him."

"Let all the earth keep silence" do they say?
But hark! the winds of Heaven sough and sing,
The thrushes chant, the dancing tree-tops play,
The glad earth is rejoicing in her spring.

The vaulted skies in festive blue bend low,
The feathered choristers, in glad thanksgiving,
Lilt their gay matinals as though
Their hearts would break for very joy of living.

The west wind rises in a wild-excelsis,
The violets swing their incense to the skies,
The poppies hold their golden chalices,
To hear the words: "Behold, I will arise!"

The roses, shedding soft, pink petal-showers,
The lily-bells and cherry-blossoms say,
"Not silence, for this moment's grace is ours
To sing: 'Rejoice, the Lord is risen today!' "

—Sunset Magazine.

HER EASTER OFFERING.

IT WAS only an egg,—not a pretty one at that, for the dye had streaked, and showed glimpses of the white shell under the purple covering. It was because of this that Pollie happened to get it. She had passed a house, on Saturday afternoon, where a flock of merry children were having an Easter-egg hunt, and their gleeful shouts attracted the little stranger's attention, and made her stop to look on awhile.

How pretty the children looked!—like Easter eggs themselves, Pollie thought, as she peered between the pickets of the iron fence at the exciting hunt to discover new hiding places and unearth fresh treasures continually.

"They must have hundreds of aigs," sighed Pollie. "I wonder where did they all git so many. I spec's they's mammies did it. They's mammies ain't pore, so they cain't buy nuffin' but bread. Seems cur'ous, when white chillens has so many, they ain't a one for cullud chillens,—not a one, and I ain't never had one sence I's bawn."

It was just then that Hattie saw the little black face, with its frame of tightly wrapped tails.

"Look there!" she exclaimed to Bessie, who was beside her. "Who is she?"

"I don't know! Don't she looked funny?" And the two little girls giggled.

Pollie saw them laughing, and showed her own white teeth in a friendly grin.

"What do you want, little girl?" asked Bessie, wearing a grown-up air.

"Don't want nuffin', replied Pollie. "I's jes' a-watchin' you-all gather aigs. Who-ee, but they is pretty!" she added, at sight of the dainty basket in Bessie's hand, filled with eggs of every hue.

"How many are you going to have?" asked Hattie curiously.

"Me? None! I never gits aigs Easter, nor no yother time. Grannie cain't afford 'em, she say."

The little girls looked at each other. An Easter without eggs! What would it be like?

"S'pose we'd give her one," said Bessie.

"Yes—the purple one. 'Tisn't very pretty, I'd just as soon give it away as not." And a moment later the little black fingers closed over the treasure.

Pollie wasn't critical. It did not once occur to her that her egg was less beautiful than the others, she only knew it was hers; and her breath came so fast it almost choked her as she drew back from the fence to drop her old-fashioned courtesy, and say quaintly, in imitation of grannie:

"Thank you kindly a thousand times, little missies," adding, in an ecstacy of her own, "It's the the prettiest aig I ever, ever saw!"

All night it lay in state in a cracked glass dish on the stand beside her cot. Breakfast was poor and scanty, and grannie begged the child to eat the egg, but Pollie's eyes grew wild with horror at the suggestion. It seemed wicked to think of breaking that beautiful shell.

"It's lak vi'lets, grannie,—lak the vi'lets in the woods where we lived last spring, 'fore mammie died. Seem lak I can smell vi'lets, too. It's the onliest Easter aig I ever had, grannie. 'Deed I cain't eat it!"

The Easter sun shone clear and beautiful, and the air was filled with the jubilant music of the bells, when, impelled by their invitation, a little ragged figure slipped in through the doors of St. Andrew's and sat down on the back seat in the primary room.

Frightened at her own daring, Pollie shrank into the shadow to escape notice. But no one molested her, the sweet-faced teacher smiled at her reassuringly, so Pollie gained courage, and began to look about.

Such a beautiful place! and oh, the flowers on the platform! God's house, God's flowers, but neither the one nor the other was for little black girls. These, with the music and the pretty dresess, were for little white girls. There was nothing for Pollie except the precious egg. She drew it from her pocket and fondled it, laid it against her cheek, kissed it softly, then slipped it back again. It was happiness to know it was there. Then she began to listen to the teacher, who was telling of Easter and of all it meant to those who love the Lord. How much he must have cared for his own, to suffer for them as he did!

The teacher said: "He has given to us the blessed gift of eternal life. I think at this Easter time we shall want to do something to show how much we love Him, and will give Him all we can of the best we have."

The organ began to play presently, and the children marched up to lay their offerings in the basket, singing an Easter carol as they went. Pollie sat quietly, trying not to cry. Every child but herself had something to give Him, and she had nothing. Nothing? There was her egg! She did not hesitate. Up the aisle she went, the last of the little procession, her broken shoes making no sound on the soft carpet, her face shining with joy, and in the basket laid her treasure. She looked up into Miss Filmore's gentle face. "It's for Him," she said. "It's all I had to give."

The teacher laid her beautiful hand on Pollie's woolly head, and said: "Thank you, dear; I think it is a precious offering in his sight."—Sunday School Times.

morning every morning.

METHOD OF POTTING MEATS.

Potted meats are much nicer and more delicate than the plain sliced or chopped meats for filling sandwiches, and they give a better relish to the luncheon. You may use any fragments of cooked meats for potting, such as ham, tongue or beef, any bits of poultry, game or fish, thus finding a way to use the "left-overs," while you prepare something good for the luncheon basket. And these potted meats will often be found convenient to piece out the home luncheon in case of the arrival of an unexpected guest when you are not altogether prepared. The work of potting is not difficult in itself, and the results are far beyond that of the labor; indeed, they are not at all commensurate with it.

Here is the method of potting any kind of meat, fish or game. Chop fine, and then pound to a paste the the fragments of meat, and if you are using ham see that a quarter of it is fat. Remove the skin and all bits of the gristle before pounding, so that the paste will be perfectly smooth. Season highly with made mustard, salt, pepper and cayenne, and moisten with a little melted butter, except in case of ham, when there is sufficient fat of its own, and more is unnecessary. Pack the seasoned paste in small earthen jars or in jelly tumblers, pressing it in as hard as possible, set the glasses in a steamer, closely covered, and cook for half an hour. Then press the cooked paste down again to make a solid mass, and cover with hot melted butter. This seals it from air and will keep it good and sweet for a considerable length of time.

The mothers or the older sisters who, perhaps, know how to make only a few kinds of sandwiches, and who are as weary of making them as the children are of eating them, will find that peanut sandwiches are nice as an occasional variation of food for the luncheon. Take freshly roasted peanuts, shell and blanch them, then chop as fine as possible and make a paste which will spread upon the slices of bread by moistening the chopped nuts with melted butter, and seasoning with salt and a dash of pepper.

LEAVING THE BUNCH BEHIND.

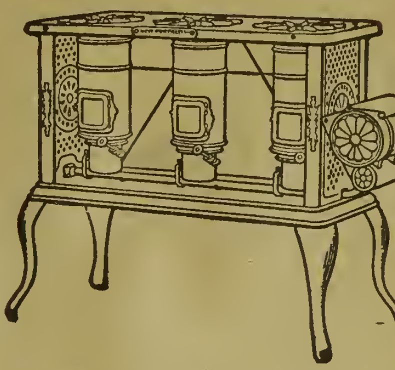
Nothing ever invented serves so admirably the triple purposes of utility, exercise and pleasure as does the bicycle.The best grade of wheels are now selling for less than one-third the prices of ten years ago, and at that the rider gets a better mount than was possible then. The Coaster Brake and Two Speed Gear features alone mark a big step forward in bicycle construction since the boom days.

Inquiry among jobbers and dealers disclosses a demand for bicycles, not only from the small boy (who has always ridden) but also from his older brother and his father also.

"Leaving The Bunch Behind" is the attractive picture adorning the gold embossed, 1908 catalogue cover of the "oldest exclusive bicycle house in America," a copy of which has just reached us. The catalogue is a work of art and is brimful of valuable and interesting matter for riders or those thinking of buying wheels. It is well worth getting and may be had by writing the Mead Cycle Co., Dept. LA 258, Chicago. They also send a wheel for 10 days free trial and will engage live agents.

NUTS.

To remove pecan meats without breaking, pour boiling water over the nuts and let stand until cold; then, when cracking, strike on the small end of the nut.



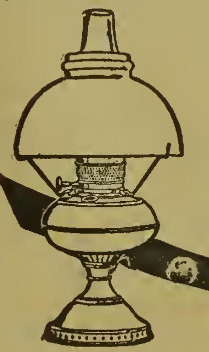
You Will Need an Oil Stove

When warm days and the kitchen fire make cooking a burden—then is the time to try a New Perfection Wick Blue Flame Oil Cook-Stove.

Marvelous how this stove does away with kitchen discomforts—how cool it keeps the room in comparison with conditions when the coal fire was burning. The quick concentrated heat of the

NEW PERFECTION
Wick Blue Flame Oil Cook-Stove

goes directly to boil the kettle or bake the bread, and none is diffused about the room to overheat it. Thus using the "New Perfection" is real kitchen comfort. Made in three sizes and fully warranted. If not with your dealer, write our nearest agency.



The Rayo Lamp Just such a lamp as everyone wants—handsome enough for the parlor; strong enough for the kitchen, camp or cottage; bright enough for every occasion. If not with your dealer, write our nearest agency.

FOOL PROOF.

An engine on a new principle has just been introduced to coast trade and is winning its way. It is the Morrow two-cycle gas engine. It is without valve or coil spring and has no packing. It has constant compression and constant explosion to each revolution and is almost perfect in action. It's makers claim "most perfect engine for pumping extant," and also guarantee it to be "fool proof." Write J. G. Bates, 860 N. Main St., Los Angeles for information.

Citrus Marke

LOS ANGELES, April 15,

ese examples indicate that too
forethought is given to the de-
pment of pumped water supplies.

At a time when there is much discussion as to the profitableness of pumping for irrigation we do well to note that many plants are poorly built and fail to do justice to the affirmative side of the question.

IRRIGATION IN TULARE COUNTY.

Continued from Page 448.

The matter of inches used cuts no figure. You use all you can handle or your ditch will carry, until you irrigate the number of acres listed, and then you close your headgate, and that is all there is to it, where an acreage toll is charged, until you are called on to pay from fifty cents to a dollar an acre, not for the amount of water used, but for the number of acres irrigated. Could a more wasteful method be devised?

200,000 Acres.

However, it must not be assumed that because attention has been called to our lavish supply and wasteful methods, nothing has been accomplished towards the betterment of conditions, for, on the contrary, more economical methods are being introduced, and thoughtful men are turning their attention to the conservation of our water and the betterment and extension of our canal system. We have now more than 700 miles of irrigating ditches, and 200,000 acres are irrigated annually.

We Are It.

One feature of our system that is of special importance and appeals strongly to the man familiar with irrigation, is the fact that the water in all instances belongs to the land. Here are no corporations that control the supply and fix arbitrary tolls for the water consumer. The gravity canals are operated either by private corporations co-operative in their nature, or by the district irrigation system. It is also worthy of note that the forestry of our water shed is largely protected by government reservations.

Pumping.

No article on irrigation in Tulare county would be complete that failed to note the new system known as "pump irrigation," which has made wonderful development of recent years. Underlying all of our county there is an immense underground reservoir of water which can be reached at a depth varying from 50 to 150 feet. The establishing of electric power plants and the improvement of the gasoline engine has made it practicable and profitable to bore wells and install pumping plants for irrigation purposes. Through this method more than 15,000 acres of land which cannot be reached by the gravity canals has been brought into a high state of cultivation. The returns from this 15,000 acres last year amounted to more than $1,500,000 and this is only about one-third of its producing capacity, as it is largely planted to orchards, vineyards and orange groves, many of which are not yet in bearing.

Will Improve.

With these facts in view we of Tulare county think that we are particularly blessed in the matter of water supply, and realize that it is only a question of a short time when our irrigation system will be greatly improved and brought up to the standard of highest efficiency.

Imperial proposes to have a free cantaloupe feed on July 4th and everybody who comes is to be given their fill of cantaloupes.

Thrifty Orange Orchard at Gridley

NE of the first oranges planted north of Tehachepi was at Bidwell's Bar, on the Feather River, in Butte county, in 1856. That tree still stands and has been photographed and tten about often. More recently many other orange trees have n planted in Butte county and the output has brought to that tion many good dollars. These shipments have been largely m Oroville, Palermo and Thermalito. But as proof of the abil- of Gridley and Biggs to also produce oranges, the Gridley rald kindly sends for Cultivator readers the above engraving.

Mr. Burleson, the editor, writes the Cultivator: "These trees very vigorous and healthy and the fruit is free from defects. e Campbell grove, a view of which is here given, is of about 3½ res, and the trees are twenty years old. The owner secures od returns from his trees."

The Herald says: "Visitors see the orange groves of this place and express wonder that the whole country is not set out to orange trees. When told that the lands on which these trees can be grown in perfection and on which the oranges ripen into delicious golden globes with flavor that sends the epicure into ecstacies of delight can be bought for $100 to $150 per acre, and that water in abundance for irrigation can be had for $1.00 per acre per year, the thing looks so unbelievably good that many of them hesitate to believe it and suspect that some hocus pocus is being played on them.

"No smut is ever found on the oranges grown here, and consequently the expensive and rather disagreeable job of washing the fruit prior to shipment is never necessary with our oranges.

"At the present time there is a great deal of inquiry for orange lands in this neighborhood and a considerable interest is being taken in the planting of trees by local land owners, nurserymen having sold a good many trees during the past few weeks."

Coulson's
Growing Chick Food

After hatching your chickens and raising them successfully up to 5 or 6 weeks old, they are worth something to you, and every one that dies now is a distinct loss in the cost of feed you have used, as well as the cost of hatching and subsequent care of them.

Therefore, in deciding what feed to use now that they are getting too large for the baby chick food, you must exercise the same care as before, to give them the best.

The Best Feed with the Least Labor

Is what you want and that is where

Coulson's Growing Chick Food

comes in.

Coulson's Growing Chick Food is rich in protein, owing to the meat and bone it contains. The grains and seeds in this food are not all ground up, a portion being granulated, so as to give their digestive organs sufficient work to insure health. The food contains a large variety of ingredients, which furnish the growing chick all it requires for quick, healthy development.

COULSON'S GROWING CHICK FOOD is especially adapted for feeding dry in hoppers, as well as dampening as a mash.

THE HOPPER STYLE OF FEEDING HAS NUMEROUS ADVANTAGES:

COULSON'S GROWING CHICK FOOD can be placed in a hopper in sufficient quantity to last for several days. If this hopper is properly constructed there will be no waste, and the consequent saving of labor in feeding is large. The chickens thrive amazingly well on it, and are kept in the most healthy condition, as with the dry feed always with them, they have no desire to gorge, with consequent digestion troubles.

Many have hesitated about trying this method of feeding by reason of the cost of the hoppers required. A good hopper for dry feeding can be made by any one at a very slight expense. We will be pleased to furnish a simple method of making these hoppers, free of charge to you.

Try the Dry Feed Method

with

Coulson's Growing Chick Food

and we are sure you will never use any other.

COULSON'S GROWING CHICK FOOD can be used for chicks from 4 to 6 weeks old up to 3 months old, when COULSON'S EGG FOOD or IMPROVED MASH EGG FOOD should be fed them.

If your dealer does not handle COULSON'S GROWING CHICK FOOD, write to us and we will tell you where you can get it.

Culture of the California Goober

E. W. Brewer of Anaheim Writes from Experience of the Growing of Peanuts, Which have Proved Very Profitable in Orange County

HE peanut has been raised more or less in Orange county for the past twenty-five years. During the past eight or ten years it has d more prominence, and there is a fully ped cleaning and grading plant at Tustin, d and operated by Mr. C. E. Utt, who has properly styled the "Peanut King" of Orange ty.

e Spanish peanut, a variety grown exten- y for the confectionery trade, and also used alted peanuts, is raised quite extensively by Utt, who has the required machinery for shing and shelling. They are such little es that it is impossible to harvest the crop by

ie market for peanuts is not nearly supplied he local product, but tons of nuts are shipped ss the continent to Los Angeles and San Fran- o, while Japan is also pretty busy at the same and lands peanuts from the Orient in San ncisco. The Japanese peanut is an inferior cle, but, of course, some venders will buy any trash that looks like a peanut to sell in the k to the peanut loving people.

he peanut requires a light soil, so that the und will not readily bake in the summer sun- ne. Peanuts have been raised with varying cess from as far north as Canada to the ex- me Southern portion of the United States, but colder northern and eastern States have too rt a summer season to raise many for com- rce. The peanut makes a pretty vine and some raise them on suitable ground in front yards home use. A large portion of Orange county is table for peanut raising, and as they require little water, it makes a profitable crop to plant tween the rows of a young orchard not yet in aring.

Three hundred acres of this nutritious nut were anted in Orange county last season, and from the neral outlook at the present time, there will be tween four and five hundred acres planted the ason at hand.

ulture.

Prepare the land to be planted the same as you ould for corn and have a well pulverized field at is light and friable to the depth of 6 to 10 ches. The time for planting should be after e frosts are over so that the young plants will ot be injured.

In this section we can plant from the first week April till the first of June and get a mature rop of nuts at harvest time. The general time f most growers for planting is from the second eek in April to the second week in May. When ou have your soil in proper condition for planting he distance apart of the rows and the distance etween the kernels in the row must be determined by the quality of the soil and the variety of the peanut that is desired to be raised. The majority of growers plant the rows three feet apart for the variety known as "Virginia Running Variety," and the kernels are dropped in the row from 12 to 20 inches apart. Some drop two at a time while many try to drop only one at a time. The Placentia Wonder vine averages four feet across, so that the rows should be from 3½ to 4 feet apart with that variety to give any show for the harvesting to the vines. A standard 3-foot wide "sled cutter" gets choked too often for economy in harvesting if one row of vines overlie the adjacent row. The Spanish peanut is planted as close together as will barely allow a horse to work the field and the kernels are drilled in, as the plants do not spread but very little. The seed should be covered about 2 to 3 inches deep.

How to Plant.

Some use a sled with shoe attachment with pipe leading upward about 18 inches, with funnel shape top, to give freedom for dropping kernels. Others use a corn planter, removing the plates, and boys dropping the seed as the planter moves along. In small patches, a light furrow can be turned with a one-horse plow and the seed dropped by hand and lightly covered either with a plow or a hoe.

There is no secret process to raise good peanuts; it only requires the proper care and attention at the right time and the good sunshine, and cultivation to keep all the weed growths down.

Good Seed.

Do not expect to raise good crops or choice nuts from cull seeds. Some farmers plant "seed potatoes," so-called, that are not fit for hog feed and wonder why they don't get as good potatoes as some one near by who only use the best selected seed. The same with peanuts—use only the choicest seed obtainable. It doesn't pay to put in a season's work on a poor lot of seed for any kind of a crop.

When the seed has been planted from three to five days run over the planted area with a two-horse harrow lengthwise of the rows, the harrow having the teeth slanted back forty-five degrees. This will kill all weeds starting since plowing and gives the peanut plants a chance ahead of the weed crop. It is a saving of going over the whole piece with a one-horse cultivator after the plants first come up.

Clean Cultivation.

After the plants are up to a size that is safe to take a one-horse tool, put the weed sweeps on the one-horse cultivator and clean out between the rows of peanut vines, going twice in each row so that you can run close to the vines on both sides.

A good job at this time will save a great deal of hoeing. A job that I have never found any one hunting for very hard. The hoeing job generally hunts for the man.

Don't Cover.

Do not pretend to cover the blossoms, as that theory is a thing of the past. A better crop is obtained on flat surface growth without covering blossoms than by hilling the vines and covering.

After the weed cutting with the horse tool is done then clean out each row with the hoe; keep your land mellow throughout the season and free from weeds.

Irrigate.

When the plants begin to blossom and get about as large as your hand run one good furrow down the center between rows and give a good irrigation. This is about the middle of June or a little later, according to the time of planting. As soon as the land will permit give a careful cultivation, going twice in each row to get as close to the plants as possible without injury. They are pretty tough by this time. Hoe over the rows again after irrigating and cultivating. In some sections, and some seasons, there is a fair crop raised without irrigation, and some growers "scoot" through the rows once with a cultivator, but I find that good care yields good crops.

As the vines begin to spread do not disturb them, as the little shoot or peduncle under each blossom enters the ground and the nuts form on the end from one to two inches below the surface. Set your cultivator narrower and keep the ground in good condition, and do not let the weeds get the start if you expect to have a good crop of nuts.

Harvesting.

We harvest the crops in this locality during October and early in November, before the rainy season sets in. Some years I have seen crops harvested as late as the middle of December, but that is taking too many chances. The rain damages the color of the shells by the mold and mildew of the vine while curing in the field.

We use a sled cutter in this neighborhood. Some use a plow with the mold board removed and a cutter welded on.

The knife of a sled cutter can be attached to any two-wheeled style of cultivator where the wheels are the right distance apart for the rows.

When cutting the vines set the blade below the nuts, so as to strike the tap root. The curved fingers slightly raise the vines, while two men following lift each vine, separating with a fork, and place them in winrows, about five rows of peanut vines to each winrow; placing the nuts down always on account of discoloring the shells by heat and sunburn, which hurts the market value, although a dark shell is no detriment. It depends on the plump kernel for seed quality. The vines should remain in winrows from 24 to 72 hours, according to the drying quality of the weather. Then shock the vines about the size of average hay cocks, lifting each vine singly with the fork and carefully handling, so the nuts do not break off and get scattered over the field. Cure the nuts from 6 to 12 days in the shock before picking, so that they will not discolor and mould in the sack after picking.

Picking.

The prevailing price for picking in this locality is 30 to 40 cents per sack holding about 40 pounds, field filled. We use five gallon square coal oil cans

THE PUMP THAT PUMPS

With the Citrus Growers

GUM DISEASE.

The following was written for the Whittier News by J. A. Marchus, of that city. He has treated over 1000 acres in the past year with gratifying results.

The question of gum disease and its cure, in the orange and lemon sections of California is one of absorbing interest to the citrus growers. It seems to be greatly on the increase in most sections, and while it has in the past confined its destruction to old orchards, within the last two years it has been steadily increasing in the young trees. The general public is not aware that in reality there are two forms of gum—one called scaly bark, and the other, "the common lemon gum." While these two forms of gum are commonly believed to belong to one class, still it will be observed that while the effect of the two is very much the same, still the former affects the trunk and branches, the later confines its operations to the roots and bud union.

Gummosa, or scaly bark, is found only on orange trees, and commences usually at the forks and extends up and all over the branches. This has every resemblance to a genuine disease. Commencing on a healthy tree and spreading rapidly all over it, gradually forms a rotten mass from top to bottom. It seems to work as rapidly on one orchard as another, when once started, and contrary ot the lemon gum, is found on the lightest and best drained soil.

Cultivation, irrigation or fertilization does not seem to check it in the least; the strongest and weakest trees are affected alike. This disease has spread in the last two years to such an alarming extent that in some localities entire orchards are threatened with destruction.

Not on Young Trees.

It is more likely to appear after the seventh or eighth year, but sometimes, if near a diseased orcahrd, it will appear on young trees. First noticed, it appears like a ringworm, usually oblong in shape an denlarging until it encircles the entire tree.

This disease yields readily in its first stages to an application or two of English Potash 99 per cent. fine in a proportion of 1 of acid to 6 of water. Scrape diseased part perfectly clean with dull instrument and apply acid with spray pump. In older and chronic cases more powerful acids are required to burn it out.

The common lemon gum differs in that it affects the roots and bud unions, seldom going more than a foot or two above the ground. Investigation in localities most affected point to the fact that this is simply a condition of that particular orchard or tree, showing mainly that it is rarely ever found on light, well-drained soil, but mostly on the heavy lower land, and then usually at the lower side or end, where the water is banked back, the trees flooded, and bud unions a foot or two below the surface. Too much water near the tree is sure to bring on the gum. The bark does not scale off like the gummosa, but rather dries up and adheres to the tree.

Prevention Is Best.

In speaking of this condition the old adage of an ounce of prevention being worth a pound of cure is certainly true. In buying trees look carefully in the top and roots of the tree for gum spots. Two months of hot weather, and no water or cultivation will make the ground hard around these small trees and gradually stop the circulation of sap. In transplanting, this tree becomes still weaker, and is in no condition to resist the sourness that has started under the bark.

Bud High.

Select trees budded high and be sure in setting out to expose the bud unions as much as possible. Keep the ground at all times loose, well worked and away from the trunk, allowing the sun to dry up the wet and sour condition usually found, and after the tree is well rooted and started, do not allow irrigation water nearer than three or four feet.

Treatment.

In speaking of a cure for this gum, several remedies have been tried with varying results. The fact that this conditions works between the bark and trunk makes it impossible to treat successfully without first removing the bark in every direction as far as there is any indication of gum. Now that you have removed all the diseased parts, it becomes necessary to supply an artificial bark until the portions removed can heal. The best and most satisfactory results are obtained by sealing over with a wax paste made as follows: 1 quart boiled linseed oil; 1 pound beeswax, 3 pounds resin; melt very slowly and apply warm. Great care must be taken when removing bark not to cut or remove a thin, fine covering next the trunk, sometimes caller inner bark, and also to make a neat cut, leaving no ragged edges. This work can be profitably done at any time of the season. Do not make the mistake of leaving a tree in spring and summer until it is done. When first noticed, cut out every indication or it will encircle the entire trunk.

ORANGES IN PORTO RICO.

There is in Riverside at this time, a man who is one of the most prominent factors in a business which has at times engaged the very earnest attention of the people of this community. The man's name is Edwin K. Martin of New York and his business is the cultivation of oranges upon one of the tropical islands off the east coast of the United States.

Mr. Martin is upon a pleasure trip to California with his wife, but took occasion yesterday to gather up all of the available information concerning the cultivation of oranges as carried on in this valley. Yesterday afternoon he was taken in charge by E. A. Chase, and therefore drifted into hands where he could receive the best and the safest information.

While Mr. Martin is quite frank in his admissions that it will be a very long time before Porto Rico can be looked upon as a competitor of California in the production of oranges, he calls attention to some very material advantages possessed by his tropical island. For example, common labor in Porto Rico is 50 cents a day. Mr. Martin's orange groves are located upon an arm of San Juan Bay, and the transportation cost to lay his fruit down in New York is 25 cents a box, the time in transporting about four days.

Mr. Martin says that the methods of handling fruit in Porto Rico are exceedingly crude and primitive as compared with those in effect in California. He speaks of the methods here as the very perfection of system, and he does not look forward with

There are some difficulties
ed from pests, like certain
varieties of scale and the green beetle, but the greatest difficulty arises from the dense growth of tropical weeds which infest the orchard.

A conversation with Mr. Martin does not indicate that the cultivation of oranges in Porto Rico is being engaged in to the extent which has been popularly supposed here. He says that there are probably several hundred growing oranges, but their holdings are for the most part small. Land values are about $100 an acre, an increase of tenfold in the past seven years. There is one point, however, concerning the citrus products of Porto Rico in regard to which Mr. Martin does not qualify. Both he and his wife insist that the Porto Rico grapefruit is the best in the world, and that the California porduct is not to be mentioned the same day therewith.—Riverside Enterprise.

STRINGFELLOW METHOD.

The Stringfellow method which Mr. Mills refers to below is, in a word, the severe cutting back of both root and top of trees at time of planting. The cutting back is so severe that there is little more than a "cutting" left of the young tree.—Ed.

WHILE we were in the Imperial valley last year we had occasion to notice a couple of apricot orchards that were planted after the Stringfellow method, and we must say that the results were not satisfactory. In both cases the stand was less than 25 per cent. The owners did not seem to condemn the method as they said they received their trees late and the hot weather came on before they got started. We are inclined to think that following the Stringfellow method to the letter in that climate is somewhat too severe, though we think the roots may be trimmed to two or three inches from the point where they fork. Experience gained at the Missouri Experiment Station should be of some value to planters in the desert regions. The trouble here seems to be to get plants to live over the first summer, unless planted under the best posible conditions, and these are in most cases unknown at the present time. At the Missouri station it was found that peaches were the least injured by pruning after the Stringfellow method, but when the trees live over the first year, they invariably develop into good trees. Many large commercial growers have adopted the Stringfellow method while others are not satisfied with it and follow the general method followed in the past. It is generally conceded that a medium between the two methods is perfectly safe and better than the old way of leaving the usual amount of fibrous roots. In this way, at least, the Stringfellow method has been of much service to growers all over the west.

PLUMS.

WHEN the Kelsey Japan plum was first introduced into California, is was considered a great acquisition and great things were predicted for it. It was tried near the coast in Central California and the color it developed was all that could be desired, but later plantings in the interior valleys proved it to be poor in color, though it is of fine quality wherever it is grown. Wickson, a plum of the same type and originated by Burbank, is superior to it in several ways. It is a more regular bearer, will color during shipment when picked at the proper stage, but while still firm and of a green color. When it is picked in this state it gives off a delightful aroma when matured. It comes in ahead of Kelsey, being out of the market when that variety ripens.

Wickson plum is not classed as a canning plum, but is one of the best sweet plums for home use as a canner.

This plum is apt to bear an enormous crop every other season and alternately a light one or no crop at all. For this reason it should be pruned heavily each year so that it will bear the bulk of its crop on the old wood and force a new growth on which new fruit buds shall form every year. In addition to this, a moderate amount of thinning should be done after the fruit is past the dropping stage. All the heavy bearing Japanese plums should be handled in this manner.

, and as they increased I gave
n box hives, about three feet long
d up endwise and hollow logs for
r homes, and without much care,
not out of bees or honey until
, when I quite farming. In the
ng of 1880 I had eighteen colonies
ch went into winter quarters. By
next winter I had thirty-five colo-
and had cleared over $300 in cash.

ciliatory.

here are some drawbacks to bees, but what business is there that has no failures? The following spring I had not a single live bee, but gallons of dead bees. I stocked up again, so I had bees for forty years, sold many dollars' worth of bees and honey, and ate hundreds of dollars' worth. A good dish of honey set before the wife and children has a very conciliatory effect upon them. The husband sometimes needs it. Try it.

Bees do not like loud words or loud actions. The first warning is a quiet buzz about the ear, the next one is a thrust of that little hypodermic needle and an injection or formic acid nature has provided them with for self-defense.—The Indiana Farmer.

Cutting Queen's Wings.—I believe that most of the scientific bee men and women who are so located have tried clipping the wings of the queen, one wing of each. It is a nice job and more than one beginner has also cut off a leg and never noticed. Now, however, they practice on the drones until they become expert. Among their supplies is a pair of clipping scissors. The one who understands the business will watch the bees until chance favors the operation, slip the scissors under the wing as the bee crawls over the comb—one clip and the wing is shortened so it will never fly again. It does not interfere with her productive powers but if she tries to go out with a swarm, she tumbles in the grass and will get stepped on if clumsy, inattentive feet are blundering around.

It pays the beekeeper to go visiting occasionally. Whenever occasion offers, take a trip around to other beekeepers, and a short stay with them may make you more enthusiastic when at home again. It may also help you to learn many new and valuable kinks that will save you money and trouble or unnecessary labor. There is nothing like "rubbing up against" others of our craft, and it will only make the bee-keeping ties stronger; for "we be brethren." This may eventually lead to the better organization of beekeepers throughout the entire country. "In union there is strength." I always feel well repaid after returning home from such trips.

Supplies are too high in price to tolerate poor colonies in expensive hives. The remedy is hardly "cheaper" hives, but better bees. A poor colony in a "cheap" hive will not give as profitable results as a rousing one in a good hive.

CALIFORNIA MADE.

Ever wear any California made shoes?

Oh, yes! There are several good-sized factories making all sorts of shoes, and if the merchant thought you wanted them he would keep them. Sure.

But he is afraid to—afraid you and I, his customers, will balk at California made shoes—afraid we will say materials are not as good, or styles not up-to-date or some other kind of rot.

For it is rot. California makes good leather. They come from all over the country to buy it, and a few months later they come back to sell us the shoes they have made out of it. Funny idea, isn't it?

Well, let's change all this. Let's ask for "Made in California" goods. Let's show the manufacturers of our State that we believe them to be just as honest, just as competent, just as enterprising as the manufacturers east of the mountains.

And if you ask your grocer and your other dealers for "Made in California" goods, you will be surprised how many he has and how good they are.

COTTON IS KING!

FREE COTTON SEED FREE

We have secured from a Texas grower the best strain of Cotton. This is what he says of it: "After trying many of their so-called Improved varieties, we find the Texas Snow Flake Big Boll variety far superior to all others, and we are now growing one thousand acres this season." It is a five lock variety that matures early and fruits very heavy. We will give for the asking one ounce of this seed to anyone wishing to experiment and learn how to grow cotton, for Cotton will be King in the Imperial Valley.

Send in your order at once. Full directions for growing will accompany each packet. Address

STRAWBERRIES FOR MARKET.

FROM a paper on Small Fruits read by John Burr at the San Fernando Farmers' Institute, we quote the following on strawberries:

The business of growing small fruits for market at a profit to the grower is not one of chance or speculation, but an assured fact, and when we learn of the success that has been attained by our neighbors, it is surprising it has not been gone into more extensivelly in this locality. Taking into consideration the fact that this end of the valley is on the eve of an awakening which will surprise even those who have pinned their faiths upon its advancement for the past twenty-five years, and when that time comes the same question will be asked by the parties who come and purchase land for orchard purposes as is asked in every other locality. What can I raise to make expenses until the time that my trees bear? Your answer can be small fruits. Say strawberries, raspberries, blackberries and Loganberries. The question of transportation no doubt will come to your mind, but when that awakening comes you will hear the bells of electric cars as they ply back and forth between here and Los Angeles, and just as sure as those cars reach here, every one will feel the effects of that hidden power not only in seeing the cars move but its effect upon the advancement of this beautiful valley in general and San Fernando in particular. The soil around San Fernando for small fruits is equal to the best, being permeated with the chemical properties, so essential to producing a solid, firm and juicy fruit in all the different varieties that are raised here.

In selecting a location for a plantation of berries have as little fall on the ground as possible to get the best use of your water in irrigating. Give it a good manuring of well rotted stable manure, and if uneven or rough after plowing it eight to ten inches deep, run a leveler over the surface to smooth it off. Then measure the ground, making the rows for strawberries not less than two feet apart. Set your lines at the stakes, take a hoe and make furrows about two inches deep and set your plants from ten to twelve inches apart up to the line, the crown of the plant about the level of the ground. Continue in this manner until the plantation is finished. As you plant run water down the small furrows made by the hoe to settle the soil around the roots of the plant.

The best time to plant strawberries is October and February. Of the two I would plant in October as by planting at that time the roots get well established during the winter and you will get considerable fruit the first year. Keep the plants well watered and cultivated during the summer months. The plants will throw out a great many runners during the growing season, but it is best to keep them cut off. Towards October and November the water should not be supplied so plentifully as it is better to let the plants harden up and rest, as it is just as necessary (if you desire the best results) that plants and trees should have a season of rest as men and animals to do the rainy season commenc some manure between the off and dig up all the you which may have rooted cultivator did not reach d summer and either use planting new ground or p in a bed to be sold for spr ing. Then fork the manur is necessary to renew t in the soil, and unless the very cold your plants will put out new growth and bl early.

After strawberry plants fruiting for three years considered to have lived th usefulness. In Scotland deners trench the strawbe at four years. They tr ground two feet deep and low with the same crop.

If it is desired to plant t berries in the orchard trees are small I would n more than three or four tween the rows of trees, much better to plant on a ground by themselves as a any kind between the rows interfere with the cross c which in summer is very to your orchard.

A FINE BLACKBERR

The Westerner speaks of a blackberry which has prov satisfactory in Oregon. W seen reference to it in Calif pers and usually as not so here as some others. Of it t erner says:

The Oregon Evergreen is and most profitable blackb garden cultivation. It grows fection in Oregon and Wa and is getting pretty well s over the mountains and foo the Puget Sound basin. The true to name in that its leave green throughout the wint there is never a season w branches are bare. It produc derful crops of berries and c to put out blossoms and fruits until late in autum fruit is of a semi-wild flavor solid that it can be shipped thousand miles and placed market in a fresh condition.

Where the plant originated of the unsolved problems. O is to the effect that a mission covered the fruit growing in moan Islands and carried p the Williamette valley of Ore set them in a garden. From ginning the plants have be tributed over the Pacific Coast But another theory is that t are native to the rainy dist the Puget Sound country claimed that the first cultiva ries were grown in Puyallup ington. The originator picke from his first three vines for ter of a century. He stated b death that he had clearly strated that the blackberry w turn one thousand dollars every year.

The evergreen berry has b making of two thrifty towns Puyallup valley. Its fruit plucked from nearly one thous dividual patches and shipped load lots to the cities of the mountain region. The surp handled by two large canneri the demand for the berries in every year. There is no dou that the berry will become a crop in many sections of the c It begins bearing after three from the planting and contin many years. There is nothing ious about the plant or its fru requires no particular care in planting or cultivation.

The Ornamental Garden

BEAUTIFYING THE HOME GROUNDS.

THE ART of landscape gardening and of beautifying farm home grounds is too often sorely neglected. This is probably due to a lack of knowledge of how to do it. Therefore I will endeavor to name some principles to be observed in the ornamentation of the country home; details to be varied, of course, to suit varying conditions, says a writer in Farm, Stock and Home.

In the artificial adornment of grounds by means of plants, nature is our best instructor. From her we can learn the proper use and combination of the different plants necessary to produce the most pleasing results. The first essential is a suitable plan; in making which the amount of land to be used, money to be expended for the purpose, soil, climate, exposure, pecularities of the site, and the kind of treatment, whether formal or natural, should all be very carefully considered.

Follow Nature.

As a rule, country homes should be improved in the natural style, as it will then be more in harmony with the surroundings. Small places, however, can be developed only in the formal style. Before beginning the work an outline or map should be drawn showing the location of all structures, kitchen garden, walks, drives, etc. In planting, the aim should be to hide all structures which are objectionable or add nothing to the beauty of the place; to locate trees and windbreaks so as to allow a good view of places of interest; and arrange the windbreak so as to afford the most protection with the least obstruction to views.

A variety of trees and shrubs should be used, which should be grouped as much as possible, and in a way to produce the most pleasing effect. Trees and shrubs should not be scattered all over the lawn, but have as much unbroken greensward as practicable.

Not Too Many Walks.

On small places, walks and drives should be few, and as straight as possible; on larger places they produce a very pleasing effect if curbed. It is usually advisable, however, to plant a bunch of shrubbery or place a flower bed in the curve, as this makes it appear necessary. With trees, shrubs and flowers, pleasing effects can be produced. While these possess an intrinsic decorative value, the value is greatly enhanced by the greensward in which they are set. A perfect lawn is one of the rarest possessions of a country home. Kentucky blue grass produces an almost perfect lawn in sections where there is a heavy soil and moisture is plentiful. In light, sandy soils, however, it should be supplemented with white clover.

Lawn.

The chief charm of a lawn consists of an even stand of grass of a uniform color, kept closely mown. In order to secure a uniform color a pure grass must be used; or if a mixture, select kinds that will not produce a mottled effect as to color. Kentucky blue grass and redtop make a very satisfactory combination. For poor soils white clover should be used in combination with the others.

In planting trees and shrubs they should, as has been stated, be grouped in bunches. The trees should be planted so as to form windbreaks, and shrubs are very effective as screens or masks for walks, drives and unsightly buildings or other objects. Each group or plant should have a reason for occupying the particular place it does. Pleasing results from grouping shrubs do not come from large numbers of one variety together, but from the blending and mixing of different varieties of different colorings and habits of growth. Each group should represent some idea of spirit, or rest, and always of beauty. This effect comes from the habit of growth. Gratifying effects may also be obtained by grouping together shrubs which will produce a floral display all summer. Glaring contrasts should be avoided, but harmonious contrasts give beauty and variety.

In grouping, shrubs with an upright habit should occupy a rear or central location, the others arranged in regular gradation to the border line, which should be given up to the small, wide-spreading sorts, so that no bare stalks shall be seen at any place. Nature herself is the best guide. Her groups are always made up of a variety of plants which are pleasingly adapted to mingling together for the best effect.

In all planting it should be the aim to conceal the work of the gardener as much as possible. The bays of curved walks and drives should be filled with groups of shrubs, so that if there is no natural object for the road to make a curve around, the plantation will serve as one, and in so doing it produces one of the best effects possible in landscape gardening. Planting bays and masking walks are among the fine arts of landscape decoration, and produce very striking results when properly done.

Influence.

Our surroundings while young have a great deal to do with our after life. If we grow up in beautiful surroundings and closely in touch with nature we will be much better for it, therefore beautifying the home grounds and refining the home circle should receive much more attention than is usually given them in the farm home.

Minnesota College of Agriculture.

LEAF CUTTINGS.

Many thick and heavy leaves may be used as cuttings. Leaf cuttings are most commonly employed in the showy leaved begonias, in succulents and in gloxinias, but many plants can be propagated by them. The whole leaf may be used. It is simply laid upon moist sand in a frame and held down by splinters thrust through the ribs. The wound made by the peg induces the formation of roots, and a young plant arises. A half dozen or more plants can be obtained from one leaf. Some operators cut off the ribs instead of wounding them with a prick. Many gardeners prefer to divide the leaf into two nearly equal parts and then set each part or the better one upright in the soil, the severed edge being covered. Fewer plants, often only one, are obtained in this manner, but they are strong.—Bailey.

Work before you rest.

LONG SERVICE

FARM WAGONS

THE wagon that breaks down and has to go to the repair shop every once in a while is not a good wagon to buy.

Such a wagon is a poor one because it is poorly constructed, and because it is made from poor and improperly seasoned material. It is dear at any price.

In the building of Weber and Columbus wagons there is always a rigid observance of these four indispensable requisites:

1. Proper wood materials,
2. Thorough seasoning,
3. Superior ironing,
4. The best of skilled workmanship.

These are the things which have built up the excellent reputation everywhere enjoyed by

Weber and Columbus Wagons.

The New Bettendorf Wagon has steel gears which make it a wagon for any climate, and practically unbreakable.

Strength and durability should be first considerations when you buy a wagon. The Weber, Columbus and New Bettendorf wagons can be relied upon for long, satisfactory service. They are built to haul heavy loads and to stand the rough usage to which farm wagons are always subjected.

These wagons are in the front rank of high-grade wagons.

With all the strength and durability of these wagons, they are not made excessively heavy. They are noted for their light running qualities.

International local agents will be glad to show you these superior wagons and furnish catalogs with all desired information. Call and take the matter up with them or write to nearest branch house.

A STEP FORWARD.

In the nineteen years since the birth of the Cultivator there have been several changes in its ownership and many in the writers and working force. With these changes from year to year have come many improvements and a steady upbuilding of the paper. Each year its circle of friends and readers has grown and today it is recognized as the leading paper of its class published on the Coast.

And now another change—which is deemed advisable—a larger organization to meet the needs of the rapidly increasing business and to make possible the many plans for the betterment of the Cultivator. To secure these ends a joint stock company has been formed of persons interested in the agricultural, stock and fruit-growing interests of the state and they hope to make the paper stronger and better than ever. All the department writers will be retained and others added. Mr. C. B. Messenger will remain with the paper as editor in charge and in the general policy of the paper there will be no change.

In making this change we regret the loss of Colonel J. J. Steadman, who for the past five years has so ably conducted the editorial policy of The Cultivator. He is a man of ability; a man of sterling honesty; a ready and forceful speaker; a strong and vigorous writer; a man who has many warm friends among his personal and business associates. And, while he retires from active work to enjoy a well earned rest and to recuperate, we hope for occasional contributions from his virile pen and shall always depend upon his sagacious and friendly counsel when needed.

The officers of the new organization will be announced later as also the plans for the further upbuilding of the paper. Mr. H. A. Perkins, who has had charge of the business management of the paper will retain that position.

CULTIVATOR PUBLISHING COMPANY.

* * * *

The above announcement by The Cultivator Publishing Company would seem to be sufficient except that in retiring from the editorship of the paper I desire to extend my personal thanks to the many friends I have made during my connection with it, for their unfaltering devotion to me and to the Cultivator.

I expressly number in this connection my former associate, Mr. H. A. Perkins, whose business sagacity and moral honesty have been most valuable adjuncts in placing the Cultivator where it stands in the business world today. I number in this connection the editorial staff, the strength of which has been recognized by me and by the public.

My large interests in other business lines now demand, for some time at least, my close attention. I need rest from desk confinement and the care which the Cultivator requires of me. I relinquish my duties with more than passing regret, but in the certain knowledge that the future of the Cultivator will be amply conserved by the new corporation which will conduct it from this date.

J. J. STEADMAN.

RAIN MAKERS.

If it were not a fact that a "rain maker" secured an agreement from some of the largest and shrewdest bankers and manufacturers of Los Angeles, a few years since, a contract to pay to him a certain sum providing he "produced" 18 inches of rainfall the following season, there might be the laugh on the farmer who is often credited with being easy game for the gold brick artist. But as stated above, the fact that these men who handle affairs in a large way, proving easy game to the "rain maker" shows that the farmers are not the only ones who are caught. Yet, on serious second thought, one cannot prevent a smile as he thinks how easy these business men and farmers have been caught by such a fake.

The fact is that last year the rain maker "made good" or in other words made a lucky guess, and the farmers felt so tickled that they paid the agreed price. This led to a contract this season and the farmers about Crow's Landing on the west side of the San Joaquin valley agreed to pay, we believe it was $1,000, providing 12 inches of rain be "produced" by April 1st. On April 1st the time was extended to April 15th. Still no more rain. One reason given by the rain maker was that at one time he was unable to secure the proper chemicals from the East.

Had the condition been right up and down the coast and we had been given a good year, we doubt not that the farmers would have been so greatly pleased that the contract would have been made good. As a suggestion, which we may be permitted to make, we may say that the Cultivator will be glad to enter into the same contract with people of any section next season and if the farmers there are granted the amount of rain which they may wish, we will be glad to receive the sum of $1000, and in order to win it will agree to send up any amount of "hot air" which may bring down the aforesaid rain.

This amount of money will be very acceptable to the Cultivator, but we sincerely hope the farmers will not be caught delivering good money to any fake proposition on the supposition that the "rain maker" is "making" anything.

THE SMALL RANCH.

"Ten acres enough" is a catchy phrase in advertising many sections in California. Not only catchy, but true. In conversation with a successful small fruit grower recently we were told that he could keep a good force of men busy on five acres and he had about reached the conclusion that five acres is a large enough holding for any one. Of course, in stock raising or grain growing, conditions are different, but for the fruit grower or the small farmer there is too little attention given to intensive culture.

Let each California farmer increase the productiveness of his ranch by giving it the very best possible attention, and we believe a
eral thing, instead of wishing to acquir
holdings he will have land to dispose o
the same time reap greater profits. If
done the day will be hastened when C
will be filled more than it is today wi
homes and opportunity will be made for
ing our population many fold.

SUPPLEMENTAL FEED.

Those who have followed Mrs. S
articles in the Dairy Department have n
she has advised the use of soiling cro
beets and every possible aid i
feeding this dry season. That the drou
make a shortage of feed now goes with
ing. The careful consideration of th
by the provident farmer will fit him th
to meet the conditions which are bef
and may bring him through the season
same amount of net profit as if given t
amount of spring rain. Stock beets is,
one of the best and the easiest grow
foods, but in addition there are the s
pumpkins and many others. Above all
forget ensilage, and end the season wit
filled silo.

Central California

Tulare is planning for a festival of music and flowers.

Driest March in 30 years all over the San Joaquin valley.

A new sheep inspector has been appointed for the Porterville district.

Fresno county will join with the government in employing forest rangers.

Raisin growers who pooled their issues on the holdover raisin crop have received very satisfactory offers.

One firm at Hanford recently shipped a solid car of eggs, which contained 400 cases, to Los Angeles.

The Horticultural Commission of Kern county has discovered that the dreaded peach moth is in that county.

The attack of the thrips on prune trees this year in the Santa Clara Valley is said to be milder than heretofore.

Winter irrigation practiced largely in San Clara orchards is said to be of great advantage to the trees in this dry season.

Entomologist Morris of Santa Clara Valley urges that the campaign against the peach tree borer be made more strenuous.

Roselle or jelly plant has been proved quite a success in San Jose and quite extensive plantings will be made this season.

Pear trees of Kern county have been seriously affected with blight, and orchards are not receiving the attention they should.

An old well which was flowing before the earthquake on one of the school grounds at Watsonville has never flowed since.

At the recent Farmers' Union meeting at Selma the attendance was very light owing to other attractions, and only a temporary county organization was formed.

At a meeting of the Parajo Valley Orchardists Association a proposition was made to establish a steamship line between Port Watsonville and San Francisco.

The California Pioneer Society of Santa Clara valley has adopted strong resolutions condemning the work of State Forester Lull in regard to Redwood Park.

Miller & Lux have a large acreage of wheat planted on their ranch near Bakersfield, which they are irrigating this season from which an immense crop will be harvested.

F. Roeding of Fresno has presented to the city a tract of land to be added to its park, and his son Geo. C. Roeding of the Fancher Creek Nurseries is to furnish the trees and plants.

San Jose says she proposes to be the "spotless town" of the coast. An appeal has been issued to the public to have the streets dressed in her best clothes for the coming of the fleet.

Dudley Moulton in charge of investigation for the Department at Campbell who has made a special study of thrips, has recently issued a bulletin giving the results of his investigation.

State Forester Lull has agreed to appoint a couple of special rangers to control the foothill district of Tulare county during the coming summer. The salary, however, is to be paid by Tulare county.

Southern California

Date culture is being extended in the Coachella valley.

Orange trains have made much better time this year than formerly.

Farmers of west Riverside have decided to give a warm reception to grape thieves.

Orange growers at Highlands claim that there is no red spider whatever in that section.

Orange Country Poultry Association is doing good work for its members in ordering supplies.

A persistent fight will be made this season by Orange county celery growers against the blight.

About a thousand acres of lima beans will be planted in the neighborhood of Talbert this spring.

Veterinary Inspector Johnson of the Bureau of Animal Industry recently visited Imperial Valley.

Melon growers at Coachella and Imperial valleys will make efforts to control the melon aphis with dust sprays.

Redlands is to vote upon an ordinance which will control the planting of shade trees along its avenues.

One trainload of California oranges consisting of 25 cars recently sent to Des Moines, Iowa, and from there distributed, sold for $23,404.

The suit between L. M. Holt and the California Development Co. has been called off and Mr. Holt's stock purchased by the company.

Cabbage market has improved somewhat and is now quoted some $2 or $3 higher than a few weeks ago when the highest price was $5.00 per ton.

"Grown in California" is becoming the slogan of many fruit producing sections and it is probable that it will be appearing more and more on fruit packages.

Fullerton vegetables have been going forward at a more rapid rate than before in its history. Within one week the Vegetable Union shipped 25 cars of cabbages.

Much celery acreage in the Peatland section will be planted to crops other than celery this year. The farmers believe that rotation will improve soil conditions.

An Imperial Valley rancher has introduced seeds of the Chico Zapote which have been planted at Calexico and Mexicali. It is a new fruit and thought will be profitable.

H. J. Whitley of Los Angeles has just returned from a trip to the Nile delta and he expects knowledge there gained to be of use in his large agricultural interests near Corcoran.

The Redlands Orange Producers' Company has made some tests with packed oranges this year and have found that with proper care in picking and packing oranges will remain good for four months.

Notwithstanding a fair market condition has prevailed this season on oranges, the returns to the grower will not be as big as they should be to give the proper interest return above the cost of production.

Brawley will have cantaloupe day on June 10th. Everybody visiting the city on that day is promised a feeling ch will be worse than that which the small boy used to have after a session with the green appe tree.

The Coast

Eggs at Portland are selling at 16 cents.

'arleton creamy at Twisp, Wash., as just reopened.

Immense plantings of onions are being made in Oregon.

Wenatchee, Washington, shipped 1322 cars of fruit during 1907.

Bellingham, Washington, has a new flour mill of 250 barrels daily capacity.

Prices of grain sacks at Walla Walla, Washington, this year will be 7½ cents.

Walla Walla, Wash., farmers are making vigorous fight against foul brood.

Finley, Washington, is beginning a harvest of an immense yield of strawberries.

The annual live stock show of Coralis, Oregon, will be held May 15th and 16th.

The recent horse show at Bozeman, Montana, was the most successful in its history.

Orchardists of Juliaetta, Idaho, are making a vigorous warfare on San Jose scale.

Farmers at Palouse will make experiments this year of shipping their grain in bulk.

Woodburn, Oregon, enjoyed a big day with parade and speeches at its recent horse show.

In some sections of the lumbering regions of Washington fine ox teams are still in evidence.

Many cattle raisers along the Salmon river, Idaho, are giving up cattle raising in favor of sheep.

Walla Walla farmers combined to fight the floods which recently did great damage in that section.

One orchard of 12,000 apple trees will be planted by the Columbia River Fruit Company at Wenatchee.

Representative dairymen of Tillamook county, Oregon, have organized a Holstein Breeders' Association.

Wheat farmers of the Inland Empire plan a farmers' congress to be held at the Spokane fair next fall.

Lewiston orchardists are planting potatoes between rows of trees claiming its clean culture is beneficial.

Fruit growers of Latah county, Idaho, have organized and incorporated for the purpose of selling their own fruit.

Whatcom county, Washington, has issued its first land registration certificate under the Torrens system recently adopted in that State.

The ravages of coyotes amongst the sheep of Western Oregon are so disastrous that the sheep men are appealing for a coyote scalp bounty law.

Shippers of apples from Portland, Oregon, into South Africa have received word of their arrival in good condition and selling at a satisfactory price.

The Oregon hop growers have made a sale in one bunch of 25,000 bales to be shipped to England. Other sales have been made near Portland at 8½ cents.

The Oregon Railroad & Navigation Co. is planning to establish an experiment station near Walla Walla, Washington, in order to establish more scientific farming methods.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed: Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Profit in the Poultry Ya

We solicit short articles of a practical nature from the fancier and breeder, giving their experiences with poultry. All inquiries pertaining t management, disease and its prevention will be answered through these co

PRESERVING EGGS.

EGGS are cheaper just now than they have been for a number of years. This, when we take into consideration the high price of feed, leaves very little profit for the producer. Every poultryman, whether large or small, ought at these times of low prices to pack or presrve his eggs until the market is better, which will probably be before a great while. Many of the eggs that are marketed now are shipped to the larger cities and put in cold storage until prices are better, thus giving the profit to the produce and commission men. This can be controlled to a certain extent by the producers if they will organize and ship their eggs direct to cold storage and hold them until the prices are such that the producer will secure a reasonable profit for his labor, feed and investment. We understand that there are a number of such organizations in the State, and we believe that the time will come when every locality will have its association just as the orange and lemon producers have their organizations. Thus they will be able to take care of the overproduction and be in a position to market at the proper time their product.

Immediate Relief.

Of course this offers no immediate relief of the situation, but the small producers can pack their eggs for a time and be reasonably sure of a better profit on their eggs.

For the benefit of those wishing to pack their eggs in water glass, we give the recipe for use of water glass.

Water Glass.

Use pure water that has been thoroughly boiled and then cooled. To each 10 quarts of water add one quart of water glass. Pack the eggs in a jar and pour solution over them, covering well.

Keep the eggs in a cool dark place. A dry cool cellar is a good place.

If the eggs are kept in too warm a place the silicate is deposited and the eggs are not properly protected. Do not wash the eggs before packing, for by so doing you injure their keeping quality, probably by dissolving the mucilaginous coating on the outside of the shell.

For packing, use only perfectly fresh eggs, for stale eggs will not be saved and may prove harmful to the others.

Water glass is a very cheap product, that can usually be produced at not to exceed $1.00 per gallon. Water glass is sodium and potassium silicate, sodium silicate being usually the cheaper. If wooden kegs or barrels are to be used in which to pack the eggs, they should first be thoroughly scalded with boiling water, to sweeten and purify them.

We also quote from a bulletin issued by the Arizona Experiment Station, on preserving eggs. Although we do not quite agree with them as to water glass being expensive and hard to obtain away from commercial centers. For it is advertised in our columns and is very reasonable as one dollar's worth is enough to preserve 1200 eggs.

The preserving materials seal up the pores in the shell and thus prevents the entrance of bacteria as well as evaporation and co shrinkage of the egg conter old method of greasing the make eggs keep better depe this fact. Such eggs cannot because the impervious shell permit the escape of the enc which expands when he bursts open the egg. By s commoner purposes the egg economizes the fresh egg there is an ever-increasing for use as raw food in the t of certain diseases.

The Packing.

When eggs are to be ke short time only, one of t methods of packing is suffic this purpose they are emb some fine material such as oats, sawdust or salt. Care taken that the packing m perfectly dry and free fro There is always danger of eggs by the growth of moul inside of the shell, as the w frequently observed. A bette said to be the use of egg These are arranged in a place and are provided wi so that the eggs may be end. Handled in this way, said to keep better than when Preserving in some chemic tion is, however, a much safer for general use.

There are two solutions used for preserving eggs, which has its advantages an vantages.

Limewater Method.

The commonest and oldest vative is limewater. A few of quicklime are slaked in a vessel of water, and after the of lime has settled out the clear is poured over perfectly fresh e a clean jar. A very small amo the slaked lime may then be to replace the lime which will arated by the action of the air. a few days a thick crust w on the surface, which should disturbed, for it prevents eva and excludes the air. Some to the limewater and claim proves the quality of th Limewater preserved eggs w well and are serviceable for poses excepting to fry, the y holding up well and the eg apt to become mussy. There great tendency for the white to watery, but this does not ren egg unwholesome. They are serviceable for baking and f purposes as fresh eggs, excep the whites cannot be beat great advantage of this me the ease with which lime m tained, as it is readily acce the most remote places.

Water Glass Method.

The other common preserv water glass. This is diluted from ten to twenty parts of but even greater dilutions will when the eggs are to be kept short time only. We have obs that the stronger the water gla lution the less apt the yolks ar break when fried. Water glass better results than limewater, difficult to obtain and quite

sive away from commercial centers. It should be given the preference wherever available, although very fair results can be obtained with limewater. One lot preserved in June in nve per cent water glass solution was still in very good condition the following March.

It is absolutely essential that eggs for preserving be perfectly fresh. They should be preserved within twenty-four to thirty-six hours after being laid. It is not safe to preserve eggs whose history is not known, such as those obtained from dealers. By following one of these formulas a fall and winter supply of cheap eggs may be had which is fully as serviceable for most purposes as high priced fresh eggs, and which will not have that peculiar stale taste so charteristic of shipped cold-storage eggs.

* * *

Hired Girl: "How long do you want the eggs boiled?"

Mrs. Newwife: "I don't know, Bridget; but I should think until tender, at least."

GETTING GOOD PROFIT FROM POULTRY.

One great secret of getting a good profit from poultry, as well as cows, is the weeding out of the unprofitable ones. A good many recommend the trap nest. The trap nest to the average farmer is about as practicable as would be a line of trolley cars to carry him around his farm. In order to trap-nest a flock of hens an attendant must be on hand to release the hen after she has laid and give her credit on the books. A farmer cannot do this. A set of trap nests is all right in its place, and that place is where hens are kept in sufficient numbers so an attendant is continually about the hen houses up to 3 or 4 o'clock in the afternoon. How then are we to judge which are the layers and which the drones? My method is to judge by their looks and actions.

There is as much difference in the shape, disposition and appearance of individual hens as there is in individual cows or horses. This difference in characteristics can better be accurately judged in pure bred flocks than in flocks of mongrels, for with the former, when you have studied the breed you have adopted, as everyone should, until you have the shape imaged in your head and can recognize it anywhere, you have more uniform individuals to judge; while with mongrels and crosses, after the first cross especially, you never know what you are going to get either in shape, color, eyes, comb or general charcateristics.

A hen that is soonest off the roost in the morning and the last to retire at night is what we call a hustler. She is looking for something to eat

Feed the Chicks and Kill the Gophers
West Coast Chick Feed
A full, rightly balanced ration for the little ones, to be fed dry. All pure feed, no filler, no waste. The biggest seller because the best made. Keeps them growing and healthy. For sale by many dealers; if not by yours send direct to us.
Bille's Gopher Poison
is most attractive to gophers, squirrels, etc., but sure death. Endorsed by Agricultural Colleges and Experiment Stations. Has had the greatest success for years in the Middle West, and also here in California last season. Circular with many testimonials and Affidavit of 201 killed in one day. If your dealer hasn't it, send $2.50 for two bottles, (not less than two) express prepaid by us. Money refunded if not as represented—so printed on the bottle.

Stock and Eggs in season
M. E. Dillingham, Box 67 San Gabriel, Cal

from which to produce an egg. A hen to produce eggs in large quantities must have good capacity to take food and good digestive organs to digest and assimilate the food eaten. You naturally, therefore, look for a long keel, apparently lengthened by a full breast filled out square with the keel by a good full crop. In such a hen the abdomen, while not bagging down much, will be well distended, showing egg capacity. You seldom see a hen, narrow between the legs and abdominal lines straight back from the legs, giving her a squeezed-in appearance from behind, that is a heavy producer. She is like a dairy cow built on beef lines. I prefer a hen with legs well apart, full breasted, with well developed abdomen. This indicates stamina and vigor. If she has a bright eye, red healthy looking comb and head adjuncts, and has that alert carriage, coupled with the other characteristics mentioned, she is pretty surely a profitable hen, and watching will prove her the bird for the breeding pen to increase your egg production, and at the same time a carcass built on these lines is capable of supplying a trade for fancy table food.—New England Farmer.

A FINE IRRIGATION GATE.

The pump head which has been so successful in many deep wells of California and whose popularity has greatly increased, is not the only product of the Pomona Manufacturing Company. That concern is now putting out a water and money saver in the Pomona Patent Pressure gate for irrigation purposes. These gates are made similar to the ordinary slide gates with the improvement that permits of locking so as to deliver a certain quantity of water. The locking device also aids in making a perfectly water tight joint when all the water is cut off.

Irrigators should look into it. Write Pomona Mfg. Co., Pomona for particulars.

TURKEYS.

It is not uncommon to receive numerous letters from farmers all over the country at this time of the year stating they are unable to obtain eggs early in the spring, and in consequence, wish to place their orders early for breeding stock. At this writing we are receiving orders for breeding turkeys for future delivery, indicating the demand for turkeys during the season of 1907-08 will surpass that of 1906-07. Hence, no time should be wasted in trying to raise every poult incubated this year.

No Use Trying.

Now and then you will run across the individual that says: "It is impossible to raise turkeys and there is no use in trying." Put him down as a calamity howler, for that is what such fellows are, pure and simple, and you will always find them in every avenue or profession. It is the optimistic class that mets with success and not the pessimistic. Those that live in rural districts are the ones that the Allwise Creator seems to smile upon when it comes to growing turkeys. It is useless for the city people to try turkey culture, as turkeys do not thrive in confinement. Therefore, only those that can afford unlimited range can launch out and reap a rich harvest from the proceeds of his turkey crop. The farmer is responsible for a shortage in the turkey supply. No other class of people can be responsible for the shortage in the turkey crop. The farmers must bear this "blunt," hence the individual that is blessed with country life and turkeys is simply in "clover," for he is well aware the demand is far greater than the supply, which, beyond a doubt, encourages him to use every effort to mature every turkey incubated for the short supply of this great commodity insures remunerative prices. Consequently there is no branch of farming, that affords greater opportunities for easy money making than turkey farming. We well realize that if it were possible to raise one thousand turkeys of the highest type, we would possess a good fortune, but to raise turkeys in thousand lots is next to an impossibility, at least it is so with us, and we have the impression it is likewise true with our brother poultrymen.

Learn Mistakes.

Yet they can be successfully raised in limited numbers on unlimited range. The subject of turkey culture should be studied from A to Z, then the masses of amateurs would soon learn their greatest mistakes are made in trying to raise too great a number on too limited range. It must be understood that turkeys must be raised in limited numbers and on unlimited range. When we conform to these rules we will raise more turkeys of larger size and finer in quality. Judicious management of turkeys tells the tale at the end of the season.

The month of June is a very trying month on turkeys, especially if the lice are not kept at bay. Turkeys are benefited by roaming the fields like any other domestic fowls raised on the farm. If you handicapped the turkey in the respect of roaming the fields for worms and bugs, your efforts to mature them are wrought asunder.

Hundreds of turkeys that are half-grown are lost by allowing them to become thoroughly drenched in a cold rain. Great losses may be avoided by going after the turkeys at the appearance of approaching storms. Turkeys at this age should be fed on the soundest grains possible to

erfectly to inoculate the soil.

Take enough soil three or four inches from the surface put it into a barrel and fill up with water; turn in the beans and stir them around carefully, then spread out on a barn floor or on wooden trays to dry. Plant the beans about three inches deep and cultivate the same as a corn crop. These beans will make a balanced ration if added to the corn as it is put into the silo.

Roughage Necessary.

Rough food seems to be needed by all our farm fed stock. We have had a repeated experience this winter. We bought some rough hay for outside animals; it was mixed and very coarse stuff. The foreman ran short of the regular hay and concluded to feed some of this coarse hay rather than stop to haul up the good hay. The horses began to pick up and look sleek, the same as they do on sorghum hay. We have had this experience several times, and believe that rolled barley is too concentrated and the need of rough food is very great. The wheat, oat and barley hay is dry in the stalks and the stock eat the heads or grain portion rather than the whole of it clean. This wild hay is full of annual grasses and of growth that give them appetite. The work stock did so well that for the last two weeks the carriage horses have been fed on the rough hay. They are responding by becoming overfat without an increase of grain or less driving. In the stomach of the horse no doubt the coarse hay is like fruit and asparagus or lettuce, to us, of lower nutritive value than the heavy cereals. yet much more liked by us, as it makes us more buoyant and helps the body to throw off its wastes more easily.

A Balanced Ration.

The best formula for feeding cows for profit seems to be about as follows. A hundred weight is made up as follows: 60 pounds of middlings; 30 pounds of beans; 10 pounds of oil cake. The middlings may be replaced with ground corn entirely. The oil cake meal may be omitted, but I like it as adding concentrated food in a quick way. The mixture as first given is excellent for the brood mares for the first six weeks after foaling, then drop out the middlings by degrees and replace with rolled barley; let the brand follow until the mare is five months from foaling and is on her regular feed. Then this mixture put dry in a manger can hardly be surpassed for the first feeding of the young colts. In feeding oil cake I should at first only put in five pounds instead of ten, as it may prove too laxitive when the animal is not accustomed to eating it.

The cows may not at first eat readily of the mixture of oil cake, but they become very fond of it in time; it is really an acquired taste like that for olives or bananas. The addition of fifty pounds of bran with a little salt will soon accustom them to the oil meal taste. At present with a grass run we are feeding the cows two pounds a day of this mixture. We will gradually increase until they receive a quart dry measure at each milking time. The price today of middlings is $31.00 a ton; bran $30.00 and oil cake 3 and one-half cents a pound.. Big figures that make one sigh for a full silo to reduce the expense. When the ration is mixed it costs about $1.75 a hundred.

DE LAVAL
SEPARATORS
MAKE THE
BEST BUTTER

The one purpose of every thinking buyer of a cream separator is the making of the most and best cream possible, whether for home buttermaking, creamery patronage, or any other use to which cream is put.

It is possible to "claim" almost everything for the various makes of cream separators, but the one indisputable fact that would-be competitors do not even attempt to get around is the unquestionable superiority of the DE LAVAL machines in the making of the best butter.

Year after year, dating back to the invention of the "ALPHA-DISC" system of DE LAVAL bowl construction, butter made by users of DE LAVAL machines has scored highest and won all higher awards in every large and thoroughly representative butter contest throughout the world.

Beginning with the first great annual contest of the NATIONAL BUTTERMAKERS' ASSOCIATION in 1892 and ending with the 1908 contest at Minneapolis, March 11th to 13th, not only the HIGHEST but every anywhere near high award has been made to users of DE LAVAL separators and more than nine-tenths of all exhibits scoring above 90 per cent. in quality have been DE LAVAL made.

THE ROLL OF HONOR
ALL DE LAVAL USERS

The First Prize winners and their scores at every convention of the National Buttermakers' Association since its organization in 1892 have been as follows:

1892 Madison, Wis., Louis Brahe, Washington, Iowa..........Score 98.
1893 Dubuque, Iowa, C. W. Smith, Colvin's Park, Ill..........Score 97.
1895 Rockford, Ill., F. C. Oltrogge, Tripoli, Iowa............Score 98.
1896 Cedar Rapids, Iowa, Thomas Milton, St. Paul, Minn....Score 97.82
1897 Owatonna, Minn., H. N. Miller, Randall, Iowa.........Score 98.5
1898 Topeka, Kan., Samuel Haugdahl, New Sweden, Minn..Score 98.

1906 Chicago, Ill., A. Carlson, Rush City, Minn................Score 97.
1907 Chicago, Ill., A. Lindblad, North Branch, Minn........Score 97.5
1908 J. C. Post, Hector, Minn..................................Score 98.
(There were no conventions in 1894, 1903 and 1905.)

In the great annual contest just held 504 of the best buttermakers in the United States competed, with first, second and third, and all important awards being made to users of DE LAVAL machines.

At each of the two big National Dairy Shows held in Chicago in 1906 and 1907 DE LAVAL butter made a CLEAN SWEEP of all highest prizes, and the general average of all the DE LAVAL made entries was conspicuously higher than the general average of all entries using other makes of separators.

Going further back, DE LAVAL made butter received the GRAND PRIZE at the ST. LOUIS WORLD'S FAIR in 1904, and as well at the PARIS WORLD'S EXPOSITION in 1900.

In the hundreds of important State and country contests the world over for twenty years the superiority of the DE LAVAL separator in the making of fine butter has been conclusively proven.

THE EXPLANATION IS TO BE FOUND IN THE IDEAL DESIGN AND CONSTRUCTION OF THE DE LAVAL SEPARATOR BOWLS AND THE THOROUGHLY PRACTICAL CONDITIONS UNDER WHICH DE LAVAL MACHINES MAY BE OPERATED AND USED.

A new 1908 DE LAVAL catalogue—affording an education in this as in other features of separator knowledge—is to be had for the asking.

At this price it is not an unreasonable cost for feed, as butter fat is very high at present. About five cents a day per head will grain-feed an average herd sufficiently to be profitable, but when we go beyond that mark then we must follow the cows closely with the Babcock test to see if it is a paying proceeding.

I was reading the other day something like this about two herds of cows that were tested by one of the cow-testing associations. In one herd the best cow yielded 450 pounds while in the second herd the best cow only made 114 pounds. If this butter fat sold for 25 cents a pound the best cow earned $112.00, while the poorer one only earned $35.00. The one cow made $87.00 more in a year than the other one. Suppose these cows cost the usual California price of milking and feeding the one cow was a loser while the other paid a living profit. This is, of course, an extreme case, but it is not to be considered that there are not cows that make only 188 pounds of butter in a year. The extreme consists in that it was the best the man had. It is to be hoped he had no more than one; ten like that would have landed him in the poorhouse.—M. E. Sherman.

HOW TO PREVENT RETENTION OF AFTERBIRTH.

There are certain periods in which special care of the cow should be considered. The pregnant cow should have exercise, and as regards both exercise and food, nothing is better than nature's care, such as she gets while at pasture. She should not be given ice cold water to drink, or be exposed to violent excitement, such as being chased by dogs, riding or being ridden by cows in heat, driven through narrow gateways, compelled to jump ditches and fences, hooked by other cattle, driven on icy or slippery ground, or being kicked and pounded by vicious attendants.

The diet should be good, clean wholesome feed, such as will produce the greatest amount of strength and yield of milk both for the profit of the owner, and the nourishment of the foetus.

Much more is expected from the cow than any other domestic animal. In the breeding cow the value of the calf is the important consideration, and in the dairy cow the yield of milk. In either case the system is at all times under a continuous drain, furnishing blood, muscle, bone and sinews for the foetus, at the same time producing milk either for another calf by her side or for the profit of the owner.

For this reason the cow should be given a special amount of care and attention. She is the surest and most reliable of all farm profit producers, the one animal the owner can bank upon to always produce her share of income, providing she is given a reasonable amount of care, which consists of pure water, good, clean, wholesome food and such ingredients as will regulate and control the nervous system and stimulate the sluggish organs, of which a pregnant cow is usually the possessor. The sluggish organs are usually one of the greatest causes of the retention of the afterbirth, at the same time being a cause of constipation, which is only a symptom of the former.

To prevent the conditions which cause a cow to retain her afterbirth, it is necessary to give such ingredients with the food as will have an affinity for the genital organs, and

will enable them to perform each and every function that nature demands them to perform at the trying and critical period of calving, thereby enabling the cow to deliver herself without an unreasonable amount of exertion, and at a reasonable time after doing so to expel the afterbirth without mechanical aid.

So much is expected of the pregnant cow, and the drain upon her system is so great that she should have proper feed and such ingredients added to it as go to make up a perfect tonic for a pregnant animal.

It is impossible to care for a cow as nature would care for her. To a certain extent she is deprived of proper laxative food and water when desired, exercise and sunlight and such vegetable matter as nature requires to keep her genital organs in a strong, healthy condition. Being deprived of these, it is necessary that she be furnished with something to take their place, thus enabling the genital organs to perform each and every function required, such as contracting upon the mature calf, causing it to be born at the proper time, and expelling the afterbirth within a few hours afterwards, enabling the cow to come in heat at regular intervals, and to get with calf when bred. —By Dr. David Roberts, Wisconsin State Veterinarian.

STOCK IMPROVEMENT IN KENTUCKY.

A new railroad was run through a populous farming district of Kentucky. It appeared to act as a magnet to all the rickety live stock of the neighborhood; numerous creatures were killed; and then sprang up the crop of claims against the railway company. The district had not been noted for its pure-bred stock, but every animal killed, whether a pig, or calf or raw-boned nag, was represented to be of finest Kentucky breeding and worth sweepstake prices.

"By Jove!" shouted a lawyer as he came to the end of a long list of claims. "I've found the way to improve Kentucky live stock. Cross it with a locomotive!"

THE ROOF.

A little puddle on the floor inside the building does not necessarily mean a leak directly overhead, but it does mean a leak somewhere. The most likely place for leaks is around chimneys and gables. These are the points where cement must be used freely when the roofing is laid, but even with the utmost care a stiff and heavy roofing will work itself away from the bricks and let the water in.

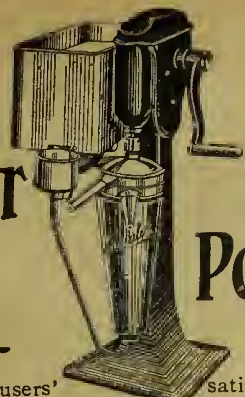
The best way to avoid such troubles is to adopt a roofing which is very pliable, as such roofing is much easier to cut and fold in the small corners.

Congo Roofing, for Instance, is both pliable and easy to handle. The natural result is that a Congo Roof is invariably tight, whereas other roofings which may be just as good in their waterproofing qualities will be frequently extremely difficult to get tight the first time owing to their stiffness and difficulty in laying same.

A Free Sample of Congo may be had by sending a postal card to the manufacturers, the United Roofing and Mfg. Co., Philadelphia, Chicago or San Francisco.

The Louisana Experiment Station reports the successful use of bisulphide of carbon for stomach worms in sheep. One drachm of the bisulphide was mixed with an ounce of raw linseed oil and that shaken up with an ounce of lime water and given as a drench.

The more months in a year a cow can be induced to give milk, the greater will be the profit in her keeping.



The Tubular Separator Leads All in Popularity

Popularity means users' satisfaction.

Satisfaction includes efficient service, easy operation, increased profits—that the Tubular does better for users than other separators.

Not what words may say makes these conditions true. What the Tubular does in the dairy is the basis and proof of our claims.

Dairy tests tell—you can make a test.

We arrange for proof, so that dairymen and dairywomen may be assured in advance of these facts; so they may know what a Tubular will do for them in their dairies.

Here are our claims of what the Tubular is and does:

Cleanest skimmer of any separator made
Easiest to Handle
Most Convenient Supply Tank
Simplest in Build
A Stranger to Repairs
Least Weight to Turn
Most Economical to Run
Most Durable in Use
Economizes Oil and
is miles ahead of any other in easy cleaning.

Many differences you can see with your eyes.

Other differences we are ready to prove.

Catalog free, telling scientific and mechanical reasons for Tubular difference from and superiority over other separators. Ask for No. 260.

But seeing the Tubular is still better. Write and ask us to tell you about it, where you can see it, and how you can prove for yourself what Tubular Service will mean for you and for your dairy, right at home.

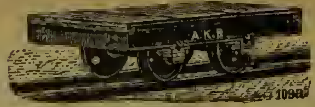
Agricultural Railways



Of late years light railways have come more and more extensively into use for all industrial and agricultural purposes, not only in Europe, but in all parts of the world. The advantages of a light railway over the old fashioned methods of transport in districts where no standard gauge lines are available, are manifold, the principal one being, of course, the economy effected. A horse will haul four times as much on a light railway line as it will on a good cart road, so that the cost of animal traction on a light line amounts to only about a quarter of the cost of animal traction on a well ballasted road. If the quantities to be transported are considerable and a locomotive is substituted for animals, the cost of transport is further reduced to about one-sixteenth of the cost of animal traction on a good road.

For plantations, farms and fruit canneries, light railways have become an absolute necessity on account of the reduced cost of transport as well as on account of the short time in which the cereals can be brought to the warehouse.

Light railways are divided into permanent lines and portable lines. On most plantations where sugar or cotton are drawn, there exists a permanent line for the bulk of the cotton. This permanent line is usually built with rails weighing from twenty to twenty-eight pounds to the yard, and is carefully laid down on a level road and ballasted if possible for locomotive traction. To this main line are connected portable branch lines constructed of light rails weighing from eight to fourteen pounds to the yard, suitable for animal traction. These extensions can be easily removed and connected with the main lines at any other point by means of climbing switches, supplied by the Arthur Koppel Company.

For permanent lines, as well as for portable lines, steel sleepers are strongly recommended and they will have four to five times longer life than wooden sleepers, and are much more economical in the long run.

The Portable Railways are usually in sections of five yards, weighing from 140 to 200 pounds per frame complete, so that they can easily be removed by one or two men, thus saving labor and time.

The Arthur Koppel Company supply in connection with this straight line, curves, switches, turntables and cars, to make up a complete equipment for the **farms, orchards, sugar plantations, beet root, vineyards and orange groves.** Their world-wide experience has produced a kind of standard material which can be adapted to any use and can easily be put together and put in service just as a child would put together his toy railway.

We succeeded in getting a few cuts of installations supplied to demonstrate the utility of such portable **railway in farm yards and plantations.**

The Arthur Koppel Company has works in this country as well as in various parts of Europe, and has sales offices and stock in all civilized parts of the globe.

The portable railway, which is their main feature in their manufacture, has proved an indispensable article in all agricultural countries.

Spraying for Codling Moth.

Please inform me through your valable paper when it is best to spray for coddling moth, also the formula. —S. A., Long Beach.

The simple Paris green mixture is probably the best if you are spraying in a small way. This is the mixture of one pound of Paris green with 200 gallons of water. Mix the Paris green first in a small quantity of water, then put in the larger quantity and keep thoroughly stirred during the spraying. Spray first as the last blossoms are dropping, again two or three weeks later. A final spraying may be given just before the fruit becomes so heavy as to turn its blossom end down. If you prefer the arsenate spray refer to Cultivator of March 12th.

Soil Analysis.

Kindly inform me where I can send samples of earth to be analyzed to determine fertilizer necessary. I am raising potatoes and alfalfa in the Tia Juana Valley and have fine success. S. L., Nestor.

You may send your soil to the Agricultural College, State University, Berkeley. But first you should send for blank with instructions as to securing your sample. The analysis given to you may be of some value but it is so technical that we think as a rule the practical gardener will get but litle direct benefit. Keeping your soil in the best condition mechanically and chemically is probably the best advice to be given.

Egg Tomatoes.

Is there a market in Los Angeles for egg tomatoes; that is, the small yellow ones. They make excellent sauce, also marmalade.—F. W. P., Watts.

We do not think there will be any great demand for those small tomatoes, but possibly small lots might be disposed of. Their not being known on the market would make it hard to dispose of them there, but on the wagon in house to house sale it is possible they might sell well.

Date Palm Seed.

Kindly tell me the best way to plant the seed of a date palm.—J. J. M., Laton.

If by this you mean the ordinary Canariensis for ornamental purposes you will find the propagation extremely easy if the seed is planted in

Dry Her Off.

I have a cow whose milk has lately become stringy and very bitter to the taste. Have been staking her on green feed during the day and giving dry feed at night. She is within about a month of calving time. Can you tell me what is the matter with her? H. E. S.

Dry her off. The milk is not fit to use. If too late to dry her off milk her, but wait until she is fresh before using the milk.

Potting Palms.

How may I pot palms that have come up from the roots of the mother palm and when plucked off have no roots of their own? J. W. D.

The Phoenix Palm, the common date palm and the canariensis are readily propagated by putting the suckers into a pot filled with sand, standing the pot in a saucer of water and putting it into a sheltered, warm spot. Cut half of the leaves of the sucker, that is, cut half of each leaf off entirely. The Chamaerops humilis also suckers freely and a small proportion of these will root if treated in the same way.

Mildewed Roses.

I inclose you samples of the foliage from rose bushes. The bushes are standing in a large hen yard. Last year they were very healthy and bloomed finely. The yard is kept very clean. J. C., Merced.

This is a case of badly mildewed bushes. Sulphur is the best remedy. Scatter about and over the vines. This will aid in keeping other growth from mildewing. Or, if you will turn to the Cultivator of March 12, page 397, you will find the potassium sulphide spray, which is excellent for this trouble.

Koumiss.

Please give directions for koumiss or "milk beer." Mrs. E. R. S., Santa Rosa.

See Mrs. Sherman's article, which will be in next week's paper.

Aphis.

A subscriber sends twig of orange tree covered with aphis or plant lice. Spary with kerosene emulsion.

CULTURE OF GOOBERS.

Continued from page 475.

for the field pickers, and four well filled cans make a sackful of nuts. Do not allow the pickers to gather the small and immature nuts from the vines, as that will hurt the grade of the whole crop for marketing.

Hay.

The vines with the cull nuts remaining make most excellent feed for hogs and cattle, but I do not advise the use for feeding horses, as it will sometimes cause the formation of a "hair ball" in the horse's stomach, which will in turn cause compaction of the bowels, which will always be fatal to the horse.

The cow and horse are differently constituted, and there is no better feed to raise a band of hogs or calves on than the properly cured peanut hay with the cull nuts remaining on the vine.

The hay should be hauled in the morning, when the leaves will not fall badly.

No dairy can long stand half milk, half water.

CURLY HEAD RHYMES.

Curly Head, Curly Head, what do you think,
A valentine for you, printed in pink;
Drop Teddy Bear and doll from your hand,
Come here to grandma, who can't understand
Why sweetheart so soon should get valentines
Prinked up with roses and hearts wreathed with vines.
Listen, it reads: "Dear love, it would be fine,
If I could be Curly Head's Valentine."
I can't guess who sent it, can you, Curly Head?
And Curly Head said it was Charlie, or Ned,
Or—horror struck, grandma stopped her and said,
Come, its high time that I tucked you in bed.

THE GIRL HE LOVED.

"IF YOU marry a servant girl, Philip Acton, out of my house you go, and out of my will. Your income will stop; and you may seek your fortune where you like, for you will never more have a penny of mine."

"I shall marry Mattie Morely, for I am engaged to her and I love her and she loves me, and it can not be otherwise," said Philip, sadly.

He did not disguise his sadness—he never tried to disguise anything—and this threat, which he knew his grandmother would carry out, altered all his life.

He had been brought up to expect to be her heir, and since his boyhood his only task had been to care for her property, to see to the collecting of the rents, to go about among the tenants acting as her agent.

He had plenty of occupation, it is true, and perhaps he had acquired knowledge by which he would be able to earn his bread and butter; but he had been used to spending an income that was a fine one for a young bachelor, living in good style, and he had expected to be a rich man one day.

It had never entered his head to think less of the very prettiest girl he had ever seen because she waited on table at the old hotel called the Yellow Bear.

In the course of his journeys in the interest of his grandmother's property, he had taken dinners and lunches, and once or twice during a storm stayed all night at the Yellow Bear.

And Mattie had waited on him, and he had fallen in love with her; he had told her so and she had promised to be his wife, and he had been quite sure that his grandmother would like her and be highly pleased.

Oh, how many young men are sure of that very thing! They see their lady-loves through the rose-colored glass which Cupid doles out to lovers, and do not realize the fact that the spectacles through which elderly people will regard them are generally darkened by the smoke of prejudice.

And so to-night, when Philip had seated himself beside his grandmother, and sung his love's praises and told his story, the old lady had first looked serious and then asked:

"Who is she?" And hearing, had started up wringing her hands and crying out: "Oh, Phil—Phil! I can not believe it! Hired help? You're in love with hired help? You are engaged to her? I knew the namo of Morley was not amongst the good families of the neighborhood; I thought of girls from the factory—of telegraph operators. But I never dreamed that an Acton would lower himself by choosing a servant girl; I thought he would choose a lady, whatever else she was."

"Whatever else she is, Ma
ley is that," Philip Acton sai
let me bring her to se you, a
know that as well as I. Oh
grandma, I should not hav
her had she been coarse or v
anything but sweet and

into his own hands, and chosen a maid-servant.

The next day Philip told Mattie Morley that he was to have no fortune and she guessed why, and the two young people, who saw nothing worth living for but love, swore to be true to each other, and Philip left his grandmother's home and went to town to look for a situation.

The old lady's heart ached over this. For some weeks she said to herself that Phil would be tired of it soon; but at last she began to know that the boy would be loyal to his true love at any cost, and now she made up her mind to try what she could do with Mattie. So she bade her coachman bring her carriage to the door, and was driven to the "Yellow Bear."

Concluded next week.

REFRESHMENTS FOR FIFTY PEOPLE.

A valuable aid when providing for church entertainments, weddings and similar gatherings.

As the time approaches for general church reunions, many hostesses are puzzled, when refreshments must be served, as to the exact quantities that should be prepared for a given number. For the benefit of the inexperienced entertainer the following table has been prepared from actual experiences. These quantities can be divided, sub-divided or multiplied, according to the number to be served:

Coffee, to make three gallons, one and one-half pounds. Coffee, black, in after-dinner cups, two and one-quarter gallons. Chocolate, to make two gallons, one pound. (Twenty-five to thirty cups full are counted to one gallon.)

When both tea and coffee are served: Tea, one gallon; coffee, one and one-half gallons; loaf sugar, two pounds.

Frappe or sherbert, two to three gallons. Bouillon, hot; two and one-half gallons. Bouillon, jellied, two and one-fourth gallons. Ice cream, two and one-half gallons. Brick ice cream, two gallons. Ices to serve in small sherbert glasses, one and one-half gallons. Mousse, biscuit or parfait, two gallons. Cakes, loaf or layer, two to four. Wafers, five boxes. Bonbons, three and one-half pounds. Salted nuts, three to four pounds. One-half pound of blanched almonds make 24 dessert-spoonfuls, equal to two and one-quarter pounds. Berries, seven to 10 quarts. Sugar for berries, two pounds. Raw oysters, used chopped, one gallon. Large oysters, in coquiles, seven and one-half quarts. Ham, one small or one-half large ham. Chicken or turkey, Salad, one and two-thirds gallons. Chicken salad, four pounds chicken to one quart salad, seven pounds. Lobsters, two for one quart of salad. Potato chips, four pounds. Olives, by number, 200 to 210 in bottle of one quart. Rolls, six dozen. Butter for rolls, one pound. Sandwiches, one sandwich loaf cuts into 24 slices, three to six loaves. Butter for six loaves, two pounds. (Each loaf requires one cupful of butter and paste, of other filling, one pint.) Meat for croquettes, three quarts. Mixture for timbales of patties, two quarts. Fruit jelly, five quarts Aspic or other jelly, molded, one quart to six or eight people, seven quarts. —Farm Students' Review.

Keep close to the heart of your farm.

HOMELY HINTS.

It is quite difficult to arrange the jelly bag when making jelly so that it is easily managed. A very good plan is to hem the edge of the bag over a large embroidery hoop. Sew a tape firmly to the hoop by which to hang it when put to drain. With this arrangement the hot fruit may be poured without spilling and there is no danger of the bag slipping or burning oneself. A jelly bag should always be made with a point or angle at the bottom to insure the maximum of pressure.

* * *

If by some misfortune your cake should burn, an effective instrument for removing the burned crust is a flat grater. It is far better than a knife in that it does the work more evenly and leaves a smoother surface for the icing.—Lotta I. Crawford, Assistant in Domestic Science, Colorado Agricultural College.

* * *

In cutting hard butter into even slices or tiny squares fold a piece of waxed paper over the blade of the knife used. In this way a smooth cut may be made without breaking or crumbling the butter. A piece of the paper which comes around the butter may be used for this purpose.

* * *

When covering an iron board make it on the principle of a pillow slip, making it the shape of the board and very tight to prevent wrinkling. It is a good plan to have several of these covers, so they can be frequently changed and laundered.

The Produce Markets

Los Angeles Markets

LOS ANGELES, April 22, 1908.

The heaviest receipt of butter in years, was the record of the market on Tuesday. Over 100,000 pounds was the day's receipts, which combined with the fact that the day was observed as a holiday for reception of the fleet, tended to weaken the maryet, but a breakdown prevails, which yet, but a breakdown prevails, which discourages heavy buying.

FREE TRIP TO SEE THIS HAY PRESS AT WORK

LOS ANGELES AND RETURN AT OUR EXPENSE

WE PAY YOU TO INSPECT THESE HAY PRESSES.

Instead of paying a salesman's fare to show you a small model of a hay press, we will pay your fare to Los Angeles and return, not exceeding $15.00, to examine our California Special New Century, full circle, all steel, self feed Hay Press and all others on sale there. It makes no difference which hay press you buy, we pay your railroad fare just the same.

When you see for yourself how this machine has been built expressly for heavy baling on the coast, how strong it is, how easy it is on horses, what smooth bales it turns out, you will understand why we make such an offer. It has 7-in step-over, pull power, high baling chamber, positive plunger rebound; it stands up to its work, no taking off of wheels. Has record of 39 tons per day. We will ship you one to try. If you don't want it we will pay freight both ways. Write now.

ALFALFA BEEF.

Modern Stock Methods in Arizona

IN THE MOUNTAINS BEFORE SNOWFALL.

THE RANGE FAVORITES.

ORNS and hair" were at one time a leading feature with Arizona stock tion. The Out West ine gives an extensive re- former conditions in the growing industry there, in the following by a cowboy aker is given:

re the herd of long-horns
fenceless tracts are driven;
ore the water, grass and care
Spanish scrubs are given.

ore the old-time cowboy
the midnight watch can hear
arkness-covered Indian
a coyote drawing near.

SEPARATING BANDS OF SHEEP.

No more great herds go drifting
O'er miles of winter waste,
While the sleet and snow fast drives them,
No grass or weed to taste.

No more the starving calves
On mesquite flats are found;
No more the trampled carcass
Upon the bedding ground.

No more the big spring round-up
O'er the country sweeps,
For each man has his pasture now
And each his own stock keeps.

For some one chanced to figure
That our trouble was in brief—
We raised too much of horns and hair,
And not enough of beef.

COULSON'S
CRESOLENE
Lice Killer
Disinfectant
and Dip

Dilute With Water Before Using

CRESOLENE is a powerful disinfectant, insecticide and germicide obtained from coal tar. It is non-poisonous, and non-corrosive and will do no harm to the most delicate skin.

It mixes readily with water, forming a milky emulsion, and can, therefore, be diluted from 50 to 100 times its own bulk, in accordance with the different uses to which it is put.

Thus when you purchase 1 gallon of CRESOLENE you can make up to 100 gallons of the best disinfectant at a cost of only 11-4 cents per gallon. Write us for particulars and guarantee.

proved Methods of Walnut Grafting

An Address by J. B. Neff Before the State Fruit Growers' Convention at Riverside, April 28, 1908

ently gave a few points made by J. B. Neff, eim, at the Whittier Institute on the graft- walnut, also a photo taken in Mr. Neff's or- owing a tree just grafted. The same points, much more complete form, were given at e Fruit Growers' Convention at Riverside. of the interesting history of the walnut ural directions is omitted at this time, but given later. Here is, however, that part of ess relating to grafting the old orchard:

AFTING old walnut trees in order to form top of some more desirable variety than he original has long been practiced in a ay in California, but has been confined to black walnut stocks. Almost every ariety of fruit tree has been top grafted, them several times on the same tree, but as always been a hesitancy about cutting alnut tree that was not paying, the com- ief being that the work could not be done fully. That this is without foundation is y the many trees in various parts of the otably Santa Clara valley, the vicinity of le the vicinity of Santa Rosa and others, roadside trees and small orchards have rked over at various times, running back s 1893 at Vacaville, and 1891 at San Jose. f these trees now have a spread of s of 60 feet.

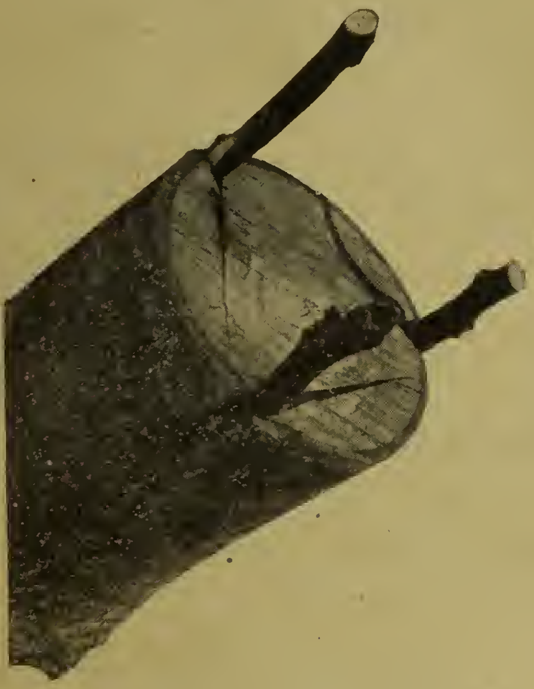
average seedling walnut orchard is not tory for several reasons; the nuts are un- size and form, the trees are not equally ive, and are largely subject to blight. It said that about one-fourth of the trees but few nuts, another fourth produce nough to pay their own expenses, leaving er half to make whatever profit is ob This will be entirely changed when the orchard is of grafted trees, grown from that came from resistant trees that pro- arge crops. Each tree will then produce ke every other tree, and if the selection ry stock has been properly done the trees very uniform in all respects.

ral styles of grafting have been practiced have had a fair degree of success, but mod- is of the cleft graft have been most gen- used, each operator making changes as ght best. If the trees are from three to ches in diameter they may be cut off at four feet above the ground and below the , then four or five scions may be placed stock, or three or four of the branches cut back to within 10 to 24 inches of the and two or three scions placed in each. other branches should be removed from unk.

trees of from twelve to twenty years should he branches cut at places where they are hree to six inches in diameter, and from eight stubs left, which will be from three feet in length and should have as many scions in the large stubs. The other es being removed before the scions are place.

method used in my orchard near Anaheim, was very successful, is as follows: Just the nuts were ready to gather last fall the rd was gone over, the trees that were non- cers and those that did not produce paying as well as those producing small or badly d nuts, were marked so they could be dis- shed later. The object in marking was to e grafting on trees that were of no com- al value and to keep up the production of walnuts to an amount equal to that of other years.

Having determined the trees to be grafted, the operator marks the stubs that are to be left by a small notch out of the bark at the place where the cut is to be made. All other branches are cut close the trunk of the tree. Several trees are marked while the assistant is preparing the first tree. The operator places the scions and the assistant follows with hot wax, covering all cuts on both scion and stock. In cutting large branches it is necessary to make two cuts, the first being some distance outside the final cut, to prevent splitting the stub or the trunk.



NEW METHOD OF MODIFIED CLEFT GRAFT.

The scions should always be of solid, mature wood, that is, with as small pith as can be had readily, and must have good living buds.

They should be about one-quarter inch in diameter and have at least two buds. The growth having buds close together is best, as shorter scions can be used which do not require so much moisture as the longer scions and consequently are more likely to grow.

When the tree is prepared use a heavy butcher knife and mallet to split the stubs, placing the knife across the stub as if a chip one-half to five-eighths inch thick was to be taken off. Then depress the handle of the knife to an angle of 30 to 45 degrees and split the edge down to 2½ to 3 inches, allowing the knife to reach the farther side of the stub but not making the split entirely across the stub. Open the cleft with an iron wedge ½ to ⅝ inch wide and thickest on one edge, placing the thickest edge toward the outside. Trim the cleft in the stub with a sharp knife so it will be smooth. Then cut the scion so as to fit perfectly and place it so the inner bark (the cambium layer) of both will be on the same line, or at least will cross twice, then remove the wedge and put hot wax over all the cuts on both stock and scion at once. It is as necessary that the scion should fit the cleft on the inside as it is to fit along the cambium layer, and also necessary that the cleft be filled with wax near the scion. The work should be examined every three or four days until leaves are formed, and if threadlike cracks are found near the scions they should be closed with hot wax so the scion will not be exposed to the air when the tree begins to grow. Any cuts on the body not waxed should have a coat of heavy mineral paint and the body and stubs a coat of whitewash.

The wax is made of 1 pound beeswax, 5 pounds rosin, 1 pint flaxseed oil and 1 ounce lampblack, melted together. The object is to get a wax that is soft enough to be pliable without running and a little practice will soon show whether the wax needs more or less oil.

A convenient furnace can be made for heating the wax in the orchard by taking a coal oil can, cutting out the top, placing four wires across, two each way, about four inches from the top, and cutting an opening to use in placing fuel in the bottom. A wire bail completes the furnace. A three-quart sauce pan is large enough to hold the wax which may be made as needed.

A good operator will place 300 scions per day and about 25 scions are needed in each tree to insure a stand; it being better to have more than is needed rather than too few.

If there is an excessive flow of sap it should be wiped off the stub at every examination of the scions and the stub covered with wax as soon as dry.

Any excessive flow of sap for several weeks will cause the loss of the scions, as the callus cannot form in water. This may be controlled by boring one-fourth-inch holes in the body of the tree near the ground. Care is needed that too many holes are not made. Three or four holes four inches deep will be sufficient to control the flow of the largest trees. No damage is done to the body of the tree as the holes soon callus over.

After the scions have made one foot growth it will be necessary to nail laths, 1 inch by 2 inches by 8 feet, Oregon pine, on the tree in such a manner that the shoots can be tied to them and the new tree formed as desired. Leave the laths on two years.

Do not take off any of the sprouts at first except such as may be very close to the scions, but as the scions grow some of the sprouts may be taken off. When the sprouts grow to two feet long they should be headed back but not removed until the following winter. Keep all the scions that will grow, the first year, and never head back the growth from a scion while it is in a growing condition. If more scions have grown than is needed they can be thinned out the next winter and if some scions should fail so as to leave a stub without growing scions, a sprout may be trained and budded the following August or September, or may be grafted the following spring.

Trees that are 15 years old when top-grafted may reasonably be expected to have a spread of 30 feet in four years and to be in full bearing. It is not at all unreasonable to expect an orchard to average 150 pounds to the tree, and trees that are 50 feet apart should produce an average of 200 pounds when well fertilized and well cultivated. Grafting may be done at any time within the six weeks before the time the buds open, and the scions may be cut as needed.

Heavy fertilization will produce larger crops, even where blight is serious, and by this means production can be increased until the orchard may be gradually changed to the more resistant varieties.

The most economical method, and the same time the best, is to grow green manure crops and supplement with acid phosphate, or superphosphate as commonly known. Buy acid phosphate that will run 18 to 20 per cent. available phosphoric acid and sow broadcast 10 to 15 pounds per tree at the time the green crop is sowed, or it can

THE PUMP THAT PUMPS

With the Citrus Growers

WHITE FLY.

Commissioner Jeffrey reports regarding the White Fly, which the force of the commission have been battling for the past year, that it will require a year of constant watchfulness to determine whether the fly will appear again at these points of infestation.

At Marysville three trusted employees of the State are on guard. They are making a plant-to-plant inspection, examining especially all the foliage of the citrus trees that had grown last fall and looking out for all possible food plants not included for defoliation in last summer's order. After these men have thus gone over the whole town two of them will be removed and the foreman of the work left on guard for a year, if any of the flies appear at emergent times. The workmen have all the plats and records of last summer's campaign, and are making a most systematic inspection.

At Oroville the work planned last fall has all been completed. This work included the complete defoliation of twelve full blocks, including and surrounding all the trees upon which the fly had colonized. Whole blocks of fine orange trees now bear only the main trunks to mark the place so recently embowered in orange shade. Outside this twelve-block district every citrus or other food plant has been defoliated or fumigated or removed. This work covered eighty-seven blocks of the city—the entire area with the twelve defoliated squares, making ninety-nine blocks treated during the last two months. As it was impossible to find a single specimen of the fly outside the twelve-block district, it seems fair to say that the pest is now entirely under control. Two men will be on constant watch at Oroville throughout the year. At the Tevis ranch, Bakersfield. Messrs. Carnes and Strong are fumigating for the third time. Our most careful inspector could not find a living fly after the second fumigation, and the present treatment is only to make assurance doubly sure—a good policy where such a peril is to be met. The outlook is most encouraging for the total wiping out of the pest. Six months hence we shall know more positively. If it is done the work will be most remarkable. I have heard of only one case where an insect pest has been wiped out after having once been established. At Liverpool a large field had become infested with the Colorado potato bug. The authorities cut away all verdure and sifted the soil with a fine screen for several inches deep. I wish it were possible to be as thorough in fighting our insect foes without destroying all verdure. Let us hope that care and persistency will utterly destroy the White Fly.

WHITE FLY FUNGUS.

Florida is investigating the use of parasitic fungi in controlling the White Fly and finds now that six species are effective, or at least aid in controlling the pest. In a recent bulletin issued by the experiment station of that State we note that experiments were begun in 1905, with the view of determining whether a recently discovered spore-bearing form belonged to the Brown Fungus or was another species. By transferring spores of the Cinnamon Fungus to culture media in the laboratory, pure growths of the fungus were obtained. Spores from these were transferred to White Fly larvae on orange trees in the greenhouse, with the result that pustules, identical with those from which the growth was first started, were again obtained. During the past summer the Cinnamon Fungus has been introduced at several places into White Fly infected trees by the leaf-pinning method commonly employed for the Red and Brown Fungi. It is to be hoped that the State Horticultural Commission will succeed so well that California will never have occasion to introduce this fungus.

SPEEDY ORANGE TRAINS.

A speed war to see who can land California oranges in Chicago in the shortest possible time is one of the possibilities of the near future in the railroad world.

With from 12,000 to 15,000 cars of citrus fruits still to be shipped East, the next few months, the prize is a big one, and competition is exceedingly keen—much more so than heretofore.

It is said that a combination of the Burlington, Denver and Rio Grande and Salt Lake roads is setting the pace in speed at present.

Gould line officials say they are putting oranges into Chicago on the seventh day from the time of shipment.

Other roads are said to be taking eight days for this service, but it is doubtful if they will remain behind the Salt Lake gateway combination.

"All the roads are making better time than they did a year ago," said one railway official. "They used to take nine days to put oranges into Chicago. Now there is much less westbound traffic and the tracks are comparatively open. If we cannot make good time on citrus fruits now, we never will."

The shippers are now routing their own fruit, whereas a few years ago the transportation companies routed it, which is one reason why competition is keen in giving good service. It is said that recently the Salt Lake road has been getting more of this class of traffic than it did earlier in the season, when the Santa Fé and the Southern Pacific took almost all of it, dividing the business about equally.—L. A. Express.

We are astounded that any orange grower in this State would be so idiotic or criminal as to take into his orchard or community orange boxes from the infected White Fly district of Butte county. The man's name is given by the Lindsay Gazette as F. E. Harding, of Naranjo, Tulare county, in Central California. He bought 1000 boxes in Butte county, where the White Fly of Florida was discovered and vigorously fought last year, and had them shipped to Lemon Cove, the nearest point on the railroad. A storm was aroused when the orange growers heard of his action, but the boxes had been hauled to Mr. Harding's packing house, and he refused to burn them. He later thought better of his action and burned the whole outfit and fumigated his packing house. But if there were any living White Flies in the consignment it will cost the growers of that section hundreds of thousands of dollars.—Redlands Citrograph.

ıg become accustomed to dep- s as regards a home, it is ıtural that the conveniences of a home should be deferred much longer than the growing prosperity of the farmer would warrant. There are farmers in the Pacific northwest today who have no possible excuse for the inconvenient, uncomfortable, restricted and generally miserable dwellings on their otherwise fine farms.

It is time to think of these things. It is time to act upon them.

It is not to be denied that there are many fine farm homes in the Pacific northwest; that more and more are being built every year; that the spirit of progress is abroad in the land.

There is no way by which readers can help themselves, their neighbors, or aid in the development of the country more effectively than by going into this campaign for better farm homes.—Spokesman Review.

LATENT LIFE OF SEEDS.

In a paper before the European Scientific Society we note the following summary of the results of a prolonged study of a large number of species of seeds.

The author found that the integument of some seeds after a certain amount of drying became impermeable, so that the seeds exhibited no swelling even after a lapse of two years. Under the prolonged action of water or water vapor the integument of most seeds becomes permeable, allowing gases to comply with the usual laws of diffusion. Alcohol, ether, chloroform and acids had no effect on the vitality of the seeds so long as the seed coats remained impermeable. When subjected to the extremely low temperatures of liquid air the influence of this medium was proportional to the amount of water in the seeds. Tests of old seeds showed that they did not retain their vitality indefinitely.

The gaseous exchange in seeds kept in the dark for a month or two was reduced to a minimum. On the contrary, it was considerably increased in seeds kept in the light. The permeability of the seed coats and the proportion of dehydration of the seed was also found to influence it. The exchange of gases in latent seeds is said to be due to simple chemical oxidation, and it can be entirely suspended for a time without destroying the germinative power of the seed. The dehydration of the seed was found essential to prolonged vitality.

The author was unable to determine whether anaerobic life in seeds is due to an actual suspension of the power of assimilation on the part of the protoplasm or whether the protoplasm and nucleus of the cell are nourished by the reserve material of the phenomena of life carried on, but in a very greatly reduced degree.

INTEREST THE BOY.

If the boy can be interested in his work—made to feel that he is a farmer, not a slaveboy, there will be less desire to leave the farm. When he is older, aside from his practical agricultural education, give him an opportunity to learn enough geology to interest him in the soil in which he works, enough botany to enable him to appreciate the beauties of plant life around him, enough zoology to excite his curiosity as to the developments of species and breeds. This will give him a love for his profession and he will be not "The Man with the Hoe" but the Farmer.—Farm,

Deciduous Fruit Cultu

PREVENTING APPLE SCAB.

Every apple grower is interested in learning everything that might be of help to him in fighting this enemy. Formerly most of the diseases of fruits were supposed to be inevitable and no effort was made to prevent the losses produced by them. In late years spraying has been found to be almost a panacea for all the ills that afflict these crops. The orchardist begins to spray in spring and continues operation throughout the season. The discriminating buyer refuses to look at an orchard of either peaches or apples where the ground is not cultivated and the orchard sprayed.

It has been found that spraying is a good way to fight the apple scab and that every effort should be made to subdue it by this means for it not only mars the appearance of the apple, but it produces a secondary disease which attacks the tissues of the fruit, producing a species of rot. A graduate of the Michigan Agricultural College working at the Geneva Station discovered that a purplish rot begins under the scabby spot of the apple and spreads throughout its entire bulk.

The rot is produced by the fungus called by scientists cephalothecium roseum, which is very bad in wet years. No remedy has yet been found for this rot, so prevention must be depended on to take the place of a cure.

If by frequent spraying the scab is prevented the rot will not manifest itself. Thus a new emphasis is laid upon the necessity of frequent and judicious spraying of apple orchards. Experiments were conducted by the Michigan Experiment Station to test fumigation and application of antiseptics as cures for the rot, but the great hope lies in spraying.

A further prevention of scab on apples is found to be raking up the leaves in late autumn and burning them. It has been found that the spores of the scab winter over in these leaves and infect the limbs of the trees therefrom, hence the benefit of raking up the leaves.

The importance of cleanliness in the orchard is emphasized in a recent bulletin issued by the Idaho Experiment Station. Scab had affected the orchard investigated so badly that there was practically no commercial fruit grown the year preceding the one in which the experiment was carried on. At the close of that season the owner had buried all the culls deeply in the earth, had burned up all the leaves and the following season cultivated the orchard and sprayed part of the trees, others being left unsprayed as check. The close of the season witnessed a marvelous change from preceding one, even the unsprayed trees showing little scab. Referring to this the bulletin says, after referring to the fact that the weather conditions were favorable to the fruit and unfavorable to the development of the disease:

The second cause for so little scab in this orchard we cannot but think due to the splendid care it received from its owner. Not only all rotten and gnarled fruit, but all infested leaves, were carefully burned or buried. I firmly believe that more can be accomplished by carefully disposing of this rubbish in the fall, and thus
obliterating the main source
tion, than by the more tedi
costly method of preventi
spread of the disease by spra

THE MESSAGE.

We have made a beginning in forest preservation, but only a beginning. The country is unquestionably on the wave of a timber famine. The only trouble with the movemnt for the preservation of our forests is that it has not gone nearly far enough, and was not begun soon enough. It is a most fortunate thing, however, that we began it when we did. We should acquire in the Appalachian and White Mountain regions all the forest lands that it is possible to acquire for the use of the Nation. These lands, because they form a National asset, are as emphatically National as the rivers which they feed, and which flow through so many States before they reach the ocean.

—Theodore Roosevelt.

owing Artesian Well on W. Simpson Property in Antelope Valley

The well, an illustration of which appears on this page, shows that ·er in certain localities in the Antelope Valley can be developed and ·emarkably low expense. The newest well sunk by R. Benedict on holdings of W. Simpson has aroused enthusiasm and great interest ong land owners all over the valley. The well, which is flowing over ·y inches and when allowed to run has the appearance of a rushing ·am, is only one of the many to be found in these parts and which attracting the attention of capitalists from all parts of the country o see that by developing the water (the one thing required) it is sible to cultivate in the valley almost anything that can be raised any part of California at the same altitude. Many contracts for lls are under consideration by reason of this latest development. e Simpson well was drilled at a very moderate cost, the flow being ·ured at a depth of 240 feet, and flows 60 inches.

COTTON IS KING!

FREE COTTON SEED FREE

We have secured from a Texas grower the best strain of Cotton. This is what he says of it: "After trying many of their so-called Improved varieties, we find the Texas Snow Flake Big Boll variety far superior to all others, and we are now growing one thousand acres this season." It is a five lock variety that matures early and fruits very heavy. We will give for the asking one ounce of this seed to anyone wishing to experiment and learn how to grow cotton, for Cotton will be King in the Imperial Valley.

Send in your order at once. Full directions for growing will accompany each packet. Address

The Vegetable Garc

SELECTING THE STRAWBERRY PLANTS.

To begin with. plants for setting should never be selected from an old strawberry plantation. Those for planting this spring or next fall should be taken from runners which have been produced last summer on plants set last spring. The prevalent custom of taking plants from an old strawberry plantation is the cause of more failures, perhaps, than any other mistake in the growing of strawberries. Every year that a plantation grows the individual plants become weaker and weaker. They get crowded by rooting down runners every year and become devitalized in their struggle for room. Weeds, grasses and other plants become more and more abundant in the plantation every year that it stands. Again, the older the plantation, the more difficult it is to give the right kind of cultivation on account of the new runners that are rooted down. As an example of this, during the past year we had a four-year-old strawberry plantation on the Missouri Experiment Station grounds. The plants during this year were so badly attacked by rust that nearly all of them actually died soon after the fruiting season. New runners that were put down by the surviving plants were small, weak and slender; a very poor stand of plants, with practically no hope of a crop from them was the result. Nevertheless this bed was renovated as soon after the fruiting season as possible, and given the best of cultivation during the summer. We wanted to see what would happen to an old bed that is kept a long time in one place.

The casual observer would say of this old bed that it is of varieties which have so great a tendency to rust that they ought not to be planted. However, a new bed, set with strong plants of the same varieties last spring has made magnificent growth in the same kind of soil, and as a result has produced an elegant stand of plants that show no tendency to rust. The fact that the old bed rusted is not due to the varieties; it is due to the fact that the plants had become so crowded and weakened that they were not able to resist the rust, while the young, vigorous plants of the same varieties, freshly set, have resisted rust almost perfectly.

Plants should be taken, then, from a new patch which has never fruited. The strongest plants should be selected before transplanting. These should have a thick, stout crown, not smaller than a lead pencil, and as much larger as possible; the leaves should be thick-stemmed, stout and vigorous. The roots should be of that light yellow or white color customary to new plants and should show none of the old, dark, black, wiry-looking roots which occur on old plants. The center of each crown should show a tendency to produce new leaves in abundance. Such plants will produce vigorous runners next summer. They will insure an abundant crop next season, providing they are well cared for.

Under ordinary conditions, it will pay the strawberry grower to put out a small plantation each year for the sake of growing his own plants The strongest, most vigorous plants should be selected for this purpose and they should be given the best of

The Ornamental Garden

SHADE TREES.

CLOSELY related to our immediate needs is the choice of trees for shade and ornament. In this field, the eucalypts cut a wide swath. Here in California the taste of our people, rightly or wrongly, inclines toward evergreen rather than deciduous trees for ornament. Moreover, with characteristic Western impatience and desire for immediate results, we demand trees of rapid growth. Both of these requirements are met by the eucalypts. Among evergreens no family of trees is better adapted to our climate, and none furnishes examples of more rapid growth. When we remember, in addition, that by the judicious selection of different species for different purposes these requirments can be satisfied without any undue sacrifice of our ideals of beauty and utility, it really seems almost as though nature had designed the eucalyptus expressly to meet the exigencies of our climate and of our characteristic temperament.

Good in Its Place.

Almost all of the large growing eucalyptus will make good shade trees. For roadside planting the blue gum (E. globulus) is excellent. The commonly expressed contempt for this tree arises mainly from familiarity with neglected specimens, and cannot be taken as in any way a measure of its intrinsic beauty and usefulness.

No one who has looked with observant eyes along a well planted and well grown avenue of blue gums, their tall, straight stems and ample crowns of dark, drooping foliage framing a vista of distant purple mountain, will readily forget the fine effect of those twin lines vanishing in perspective, nor will he ever again speak slightingly of the blue gum as an avenue tree. In groups, large or small, the blue gum is no less effective, its dense foliage lending itself admirably to the production of heavy masses of somber green which contrast delightfully with the general coloring of our valley and foothill landscapes, especialy in fall time. The depth and variety of tone in such a mass of blue gums under the declining sun is wonderful.

Tropical Effect.

The beautiful glaucous blue of the young leaves is excellent for producing tropical effects in gardening, and young trees of this species are used extensively for this purpose in Europe, being replaced by new ones yearly. The tree stands pollarding well, and when once established will endure cheerfully any amount of ill usage. It has no liking, it is true, for cement sidewalks, which it has an inconvenient habit of disrupting. In fact, city streets are as little suited to it as they are to the genuine farmer. Like the farmer, it belongs in the free, open country, and there it is one of the most all round useful trees ever introduced into California.

But the blue gum is only one, though the best known, of a numerous sisterhood, and there is scope enough among the different species of eucalyptus for the exercise of even a fastidious taste in the choice of trees for ornamental planting.

Men with an agricultural education alter cases.

AMARYLLIS.

The climate of California is admirably adapted for the outdoor cultúre of the Amaryllis, which can be brought to maturity from seeds or divisions in much less time and at a mere fraction of the expense that is needed to grow them under glass in colder latitudes.

There are about 40 species of Hippeastrum, all native to tropical America, but only seven or eight of the most showy ones are generally cultivated. Some of these, such as H. pardinum and H. Leopoldi naturally have blooms seven or more inches across, others expand from four to six inches, so that hybrids bearing flowers nearly or quite a foot in diameter do not appear astonishing, in view of the results obtained during the last 100 years by European fanciers. The centers of interest in these showy blooms have been Belgium and England, where show varieties of the greatest perfection have long been raised. Some of these increase but slowly, and are held at comparatively high prices, $25 to $30 being frequently demanded for a single bulb; others in time becoming sufficiently numerous to be offered at reasonable rates. The effort is to develop flowers of symmetrical form and good habit as well as of great size and rich coloring. Raisers are particularly anxious to get rid of the green centers so characteristic of many species, and which persistently crop up in their otherwise charming offspring.

TWO AMERICAN SUNDIALS.

In America the sundial is not as common, perhaps, except in old-fashioned gardens, as it might be. But there are some beautiful ones, and the fashion of them seems to be coming in again. At any rate, two of the most noble of all dial mottoes have been written by American authors. Henry Van Dyke and John G. Whittier. Van Dyke's, on a dial in the Trask rose garden, at Saratoga, runs:

"Time is
Too slow for those who wait,
Too swift for those who fear,
Too long for those who grieve,
Too short for those who rejoice;
But for those who love,
Time is
Eternity."

Whittier's lines, written for his friend Dr. Bowditch and first used on a silver dial, have since been inscribed on the great dial over the entrance to Mount Auburn.

"With warning hand I mark time's rapid flight,
From life's glad morning to its solemn night;
Yet, through the dear God's love, I also show
There's light above me by the shade below."

LAWNS.

A nice lawn by a dwelling is one of the most refreshing things the eye can rest on during the long, hot summer days, and this is a good time to lay it out. The best success demands rich mellow soil, well pulverized, and it is needless to think of a lawn of the finest grasses without plenty of water to sprinkle during the hot summer days. Bermuda grass makes a fair-looking lawn during a portion of the year, and will do with little water. Sprinkling every day during the hot summer months gives good results and will well repay the effort.

R&O GARDEN PLOW
Light, strong and serviceable. Is furnished with Plow, Shovel, Rake, Weeder and Wrench—all interchangeable. Weight 17 pounds—light enough for a child. The best implement made for work in gardens. Write for prices and beautifully illustrated pamphlet.

STATE FRUIT GROWERS IN SESSION.

"I should like to live a few hundred years from now and see some of the improvements which you fruit growers will make in the fruits of that time. The world will then be favored with delicious fruits of which we cannot now conceive" remarked David Starr Jordan before the State Fruit Growers' Convention at Riverside Tuesday morning. He spoke of the great advancement accomplished by the scientific production of fruits and that each year shows finer flavored, more attractive looking and generally higher grade fruit.

Such advancement is encouraged by just such conventions as is now in session. The attendance on the first day, as this is written, is not up to the expectations. However, many are coming on each train and before these words are in type, Riverside streets will have a liberal showing of the white badges, which the local committee has provided. The local committee has done good work and has complete arrangements for comfort of the attendants.

Horticultural commissioners from all parts of the State are present. They will also hold interesting sessions.

The Cultivator pencil is busy and next week, and probably thereafter, a lot of good things from the discussion and papers will make good reading for the Cultivator family.

Next week alone will have several pages of valuable pointers from the convention.

California is now the third State in the Union in the production of beet sugar, Colorado and Michigan taking the honors over us. But with our possibilities fully developed it need not be many years until California wins honors at the head of the column.

GIVING THE FARMER A SQUARE DEAL.

In Los Angeles county the Assessor is instructed by the Supervisor to assess fruit trees according to their age. For instance, an assessment on apricot trees four years and older shall be 25 cents each. Citrus trees four years old, 25 cents each; if they are five years and over, 35 cents each. Walnut trees four to eight years, $2.00 per tree.

State Commissioner Jeffery, who was formerly a member of the Los Angeles County Commission, calls attention to this tax which is unjust, and further calls attention to the fact that during the year 1906-07, the Supervisors allowed their Horticultural Commissioner the total of $59.00 for protecting these trees which were assessed at the rate of $25 and $50 per acre. Mr. Jeffery says: "What a farce!" Here the farmers are forced to pay an immense sum into the county treasury for the privilege of improving their land with trees and but $59.00 of this is given back to them in protection that makes it possible to grow trees at all.

Los Angeles county is used only as an example, for we assume productive interests in other counties of this State are treated as unjustly as the fruit growers of this county. It surely is rank injustice from start to finish, the manner in which our tax system puts the greater burden of supporting the State upon the farmer. Look at the assessment blank which every taxpayer makes out and files with the County Assessor. The merchant who conducts a business of thousands of dollars a month, lumps off his great stock of goods in one item, with possibly office fixtures and a few incidentals thrown in, but the farmer has his realty in the open, where it is assessed well up to its full value, after which he must itemize every tree and list every horse, colt, cow, calf, hog, and even poultry as well as every harness hanging on his pegs, cultivator, plows, and every appliance on the farm. We hope that some day the farmer will rise up and demand more just treatment; and when he demands it he will get it.

IT RAINED.

The month of March was the dryest that the State has had in 31 years, and the greater part of April passed and still no rain, and in some sections drying winds came and aided in removing much of the moisture from the parching earth. When the rain did come, many asked: "Is it in time to be of value to the farmer?" and investigation goes to show that it was in time to do vast good and no damage excepting in a very few cases where some hay was possibly injured. In some cases the rain gauges show a precipitation of about one inch, though in the higher watersheds the fall of rain and snow will be much greater and add greatly to the irrigation supply of the coming summer. In other sections the precipitation was as low as one-eighth of an inch, but as small as it was, it was most thankfully received by the ranchers.

DIFFERENT IN CALIFORNIA.

One of the sailor boys from the batleship fleet remarked that the reception given to them since arriving in this State was vastly different from anything they had ever received before. As a matter of fact, the towns have all been thrown wide open to the visitors from the fleet; even the ordinary seaman if in uniform being granted the freedom of the cities in every sense. No fare has been needed on the street cars, and all theaters are at their service.

The young man referred to said that in the east the theaters were not free to them as here, and still more, he remarked that they were often not permitted to enter at any price. "Here we have been treated like men."

This treatment was not used by the boys as a basis of imposing upon residents, for the young men showed themselves worthy of it and were manly in every way. Of course, under such conditions a jolly good time was had and good nature prevailed. In one instance we saw where a bunch of them, perhaps between 50 and 75, had taken possession of a car and three-fourths of the number had gone to the "upper deck" and were seeing the sights from the car top. This, of course, would not be tolerated with men of the city.

If the Atlantic Coast would grant some of the courtesies which this Sta doing, it is possible a more manly set fellows would be induced to join our was formerly the case.

MAKING HASTE SLOWLY.

The long delay in issuing the proc the National Irrigation Congress, held mento last September causes the Redl rograph and some others to sizzle unde lar. The Citrograph says:

> "This is a disgrace which falls up mento, but reflects upon the whole Stat who accepted Sacramento's word of h she would make good in her obligatic writer was one of the hard workers shouters for Sacramento, and keenly humiliation consequent upon Sacramentc to keep her pledged word."

This is a little severe, perhaps; yet value such proceedings should be in pri as soon after the convention as poss rangements are now under way for th congress to be held at Albuquerque ber and if Sacramento does not wak Albuquerque Congress will be on the fore the proceedings of the old cong the hands of the people.

The old mining ditches of the Sierr Mountains are gradually being made greater value than ever they were in old mining days. These rights are be ferred to irrigation districts and in washing the gold from the soil directl now by giving the wealth in the form

Shop Talk

THE CULTIVATOR has had many r books devoted to "Poultry for Profit," a ply this demand we have endeavored gether some publications by good auth the various subjects of poultry raising.

It is our aim to assist our readers to as they may desire at reasonable price now are able to send them with the CULT at such figures as will make them very Every one interested should take adva the offer.

Our only conditions are that the CULT subscription be in advance, either a new a renewal, and that the order come dire office.

Central California

Peaches promise a heavy year at Turlock.

One field of 125 acres of celery has been planted at Turlock.

Many new trails are being opened in the Monterey Forest Reserve.

Kerman will grow a larger acreage of cantaloupes than she has in the past.

The prospects of the Corcoran asparagus farms are continually brightening.

One Tulare county man will take $1500 an acre off from his orange orchard.

Contractors at Turlock are signing up melon growers for the coming season's pack.

The late frost did much damage to the apricot crop in the neighborhood of Hollister.

The early potato crop in the vicinity of Turlock promises to be exceptionally large.

Several hundred carloads of last year's prunes still remain in San José ready for shipment.

The cannery at Hanford has been putting up asparagus from the Corcoran asparagus farms.

One apricot orchard of 1800 trees at Hollister lost practically its entire crop from the late frost.

The cannery and the vinegar works at Watsonville have been refitted for the coming season's pack.

Turlock is continuing its rabbit drives, and succeeds in slaughtering a great number of the bunnies.

The Parajo Valley says that the prospects were never more favorable for a big yield of apples and berries.

Apricot orchards about Corralitos and throughout the Green Valley promise the greatest output in years.

Unless the coming prune crop drops far more than ordinarily the output will be larger than the average year.

A three-day forest fire burned itself out in the Boulder Creek section near Santa Cruz and did much damage.

Feed and grain have suffered from the extremely warm weather and the dry condition of the soil all over the valley.

A car of orange trees shipped into Visalia containing soft orange scale were fumigated before being permitted to unload.

The Salinas creamery has been running to its fullest capacity this season. It produces about 2000 pounds of butter per day.

Santa Clara Valley Poultry & Pet Stock Association has forged ahead this year and is planning for a great show next fall.

The strawberry packing houses at Watsonville are equipped with crates and appliances for the greatest output ever from that section.

The local Farmers' Union at Riverbend recently received 42 members in one evening. It has only been organized about one month.

The farmers near Crow's Landing have made another contract with the "rainmaker," by which they agreed to pay him $3000 if he "produces" 12 inches of rainfall between November 1, 1908, and April 15, 1909.

Southern California

Almost 13,000 acres of beets have been planted in and near Oxnard.

Anaheim has a sugar beet weighing 30 pounds and is three feet long.

The Imperial Standard says that the agricultural college is a sure feature of Heber.

By recent decision of the Land Office Imperial lands may now be subdivided and sold.

The Irvine Ranch at Santa Ana has just completed the planting of 100 acres of asparagus.

Placentia is following the example of Pomona and is making a hot fight after the orange thieves.

Imperial valley has a new irrigation company in the Alamo Irrigation Company with a capital of $1,000,000.

Cannery men are investigating conditions in the Imperial valley with expectation of establishing a cannery.

The Oxnard beet crop is far enough advanced that it is declared that rain or shine there will be a good beet crop.

A bond issue of $625,000 is recommended by the Highway Commission of San Bernardino county for a system of roads.

Some alfalfa, which had been cut, was damaged by the recent rain, but the benefits vastly overshadowed any damage.

It is expected that practically all the representative orchardists of Southern California will gather in Riverside next week.

The Whittier cabbage growers are pleased with the outlook for cabbage for next season. The tomato crop is not so satisfactory.

Santa Ana is again taking up the matter of the sugar factory, and the "Bulletin" predicts that before long actual work will begin.

Coachella valley's output of onions this year will aggregate 225 cars, which is expected will be divided amongst the growers.

Hope for a big grain crop in Southern California has been abandoned and hay is advancing rapidly in price on account of dry spring.

The action of the President in creating a Forest Reserve in the Owens river valley, is received with universal approval over Southern California.

The 80-acre ostrich farm of the Cawston Company at Fullerton has become too valuable for ostrich raising and has been sold for fruit ranches.

The cantaloupe growers of Imperial valley are discussing the labor situation with no little concern. The immense output this year will tax the capacities to market the fruit. White men will be given the preference, if a great enough number can be secured.

The showers over the southern part of the State were exceedingly beneficial, though the wish generally expressed was that they had come two weeks earlier. The precipitation varied from a quarter of an inch to a good full inch in some sections. In most of the higher foothill regions one inch was precipitated, and in the higher water sheds where the irrigation systems mostly secure their supply, it was considerably greater.

The Coast

Wool of the new clip is now arriving in the Phoenix market.

A two-year-old Shire colt at Corvallis, Ore., weighs 1760 pounds.

Home grown potatoes are selling in Tacoma, Wash., at $16.00 per ton.

The Farmers' Co-Operative Association recently formed an organization at Pueblo, Colo.

The fruit growers at Lewiston, Idaho, have suffered severe losses from frost damage.

Prime steers are selling at Seattle, Wash., at prices higher than have been prevailing for four years.

Fruit growers in the neighborhood of Lemoore report practically no damage to fruit by frost in that section.

The next meeting of the Oregon Dairymen's Association will be held in Salem December tenth and eleventh.

The Oregon Railroad and Navigation Company will offer $100 for the best half acre of corn grown along its lines.

The pack of salmon along the Columbia river it is estimated, will amount to over 1,000,000 cases this season.

The opening of the Oregon Basin in Western Wyoming will throw open to settlement 250,000 acres of fine farming land.

Southern California strawberries are being reecived at Portland, Ore., and are commanding from $3.00 to $3.50 per crate.

The Washington State Fair grounds at north Tacoma were recently visited by fire and many of the stock sheds destroyed.

The farmers of Williamette, Ore., are beginning to use extensively cover crops for improving the soil of their apple orchards.

The extreme drouth at Pendleton, Ore., has endangered a large number of sheep on pasture, but only a few sheep were lost.

The Spokesman Review of Spokane estimates that the fruit output of the "Great Inland Empire" will ultimately total a value of $60,000,000.

The papers of Arizona are booming the orange industry and claim that orange growers for this season made some exceptionally good sales.

The Farmers' Union at Davenport, Wash., is receiving many new members. It has on hand now requests for 130,000 grain sacks for the coming grain crop.

The Northwest Grain Congress to be held in connection with the Spokane Fair next fall, has been receiving the support of the more advanced farmers of the Northwest.

The Hood River Apple Union at its recent meeting voted to increase its capital stock from $2000 to $25,000, the increased capital to be used in erecting a cold storage warehouse.

Colorado produces the greatest amount of beet sugar of any State in the Union, its total output last year being 422,732,530 pounds. California is third with 164,000,000 pounds.

The grain growers in the neighborhood of Walla Walla, Wash, report that the spring wheat is coming up exceedingly fine and with a strong stand. An unusual amount of land has been sown to spring wheat.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

Profit in the Poultry Y

We solicit short articles of a practical nature from the fancier breeder, giving their experiences with poultry. All inquiries pertainin management, disease and its prevention will be answered through thes

PROFIT WINNERS.

A day or two ago I was talking with a man who had visited the poultry producing sections in and around Petaluma. He had been very much impressed with the outlook for poultry in that section, but remarked that at the present time in all parts of California except Petaluma the majority of stock was produced by the farmer or rancher.

The great bulk of our poultry and eggs is produced on the farm, and under conditions that would in ordinary circumstances make the receipts practically all profit. And while this is true, yet there are many flocks that do not net their owner a cent profit during the year.

Cost of a Hen's Keep.

No hen is a success that does not yield her owner over a $1.00 per year. If we buy our feed we will find that it will cost us annually from $1.00 to $1.25 per head to keep our birds. A first class well bred hen will show a profit of $1.25 and there are flocks that are returning a profit of $3.00 per head. These, of course, are thoroughbreds and have been carefully selected for their laying qualities. But will only do so under the right conditions, which are embodied in the following rules:

First, good, healthy, fullblooded stock.

Second, constant, unvarying care.

Third, a variety of clean egg-producing food.

Fourth, clean water; clean houses and runs.

Fifth, plenty of grit and oyster shell.

For Profit.

Nearly any thoroughbred fowl will do well and return a profit, if properly cared for, I don't advocate fine feathers alone. The general utility fowl is the one for the farmer, and any quick maturing bird from a good laying strain is of the greatest importance, for it is the egg yield that gives us most profit. The poultry is a helpful adjunct, but it is the constant stream of eggs that is the money bringer.

Ordinary poultry keeping on the farm includes, almost universally, the maintenance of a flock of laying hens, varying in numbers from a few dozen to several hundreds. But on most farms no special attention is given to the production of eggs for the season of scarcity and periods of high prices.

Increase It.

The profits from such a ranch may in nearly all cases be much increased by keeping better stock, by carefully culling out the non-layers, and breeding only from the best layers, and under no circumstances breed from weak or immature stock.

A hen may be considered to consume one bushel of grain yearly and lay ten dozen or fifteen pounds of eggs. This is equivalent to saying three and one-tenth pounds of corn will produce, when fed to a hen, five-sixths of a pound of eggs; but five-sixths of a pound of pork requires about five pounds of corn for its production. Taking into account the nutriment in each, and the comparative prices of the two on an average, the pork is about three times as costly a food as eggs. There pay better to feed was fowls than to pigs, if not both.

are gypsum or land plaster, acid phosphate and kainit, a cheap potash salt. Each of these chemicals has the power of forming new compounds with the ammonia as fast as it is set free from the original combination. Wood ashes and slaked lime should never be used because they cannot combine with ammonia, while they do force it out of its compounds and take its place. Plaster is apt to produce a dry, lumpy mixture when used in large enough quantities to arrest the ammonia, while kainit and acid phosphate produce the opposite effect of a moist, sticky mass.

In Bulletin 98 of the Maine Experiment Station is described an experiment in which sawdust was used in addition to the chemicals. By this addition of an absorbent, the kainit and acid phosphate could then be used with excellent results.

Using their results as a basis for calculation, the weekly droppings of a flock of twenty-five hens, when scraped from the roosting platforms, should be mixed with about eight pounds of kainit or acid phosphate and a half peck of sawdust. If one desires a balanced fertilizer for corn and other hoed crops, a mixture of equal parts of kainit and acid phosphate could be used instead of either alone.

Good dry meadow muck or peat would be equally as good as sawdust if not better, to use as an absorbent.

In the experiment mentioned, more than half of the ammonia was lost in hen manure without chemicals when compared with that which had been mixed with them.

Fresh poultry manure at the present values of fertilizers would be worth sixty cents per hundred pounds. Figures from different experiment stations would give the product of twenty-five hens for the winter season of six months as three hundred and seventy-five pounds from the roost droppings only.

Poultry manure is especially adapted as a top dressing for grass because of its high content of nitrogen in the form of ammonia compounds, which are nearly as quick in their effect as nitrate of soda. A ton of manure preserved with sawdust and chemicals would be sufficient for an acre, when compared with a chemical formula for top dressing.

On the same basis of comparison, one hundred fowls runing at large on an acre should in a summer season of six months, have added to its fertility the equivalent of at least two hundred pounds of sulphate of ammonia, one hundred pounds of high grade acid phosphate and sixty pounds of kainit.

SECURING FERTILE EGGS.

Officials of the Department of Agriculture have been collecting data regarding the factors which affect the fertility of eggs, the question having been carefully studied at a number of experiment stations in the United States and elsewhere.

Too warm quarters for laying stock and overfeeding are commonly believed to exercise an unfavorable influence on egg fertility as well as does a cold season. The way eggs are handled or stored is also believed to affect the proportion which will hatch, as will also the conditions under which incubation occurs.

The vigor and character of the parent stock and the length of time the male bird has been with the flock are also important questions with respect to egg fertility. At the outset it should be pointed out that fertility

Feed the Chicks and Kill the Gophers

West Coast Chick Feed

A full, rightly balanced ration for the little ones, to be fed dry. All pure feed, no filler, no waste. The biggest seller because the best made. Keeps them growing and healthy. For sale by many dealers; if not by yours send direct to us.

and "hatchability" are not necessarily identical.

An egg may be fertile and still the germ does not have sufficient vitality to produce a healthy chick under the ordinary conditions of incubation. In a series of incubator experiments at the Rhode Island station, of 8677 eggs tested, 83 per cent were found to be fertile, while only 46 per cent of the fertile eggs, or 38.6 per cent of the total number of eggs, hatched under the conditions of the tests.

The various observations made, while not entirely conclusive, indicate that, in order to secure fertile eggs, which will hatch, the laying stock must not be kept in very warm quarters or overfed; the males must be kept with the hens continuously and that only eggs should be used which are produced after the male has been with the hens several days.

Only few fowls from very vigorous parent stock and those known to produce a high percentage of fertile eggs (hens vary widely in this respect) should be used; the hens should be allowed a rest after each laying period, while the eggs should be handled carefully, not subjected to extremes of temperature in storage and used only when comparatively fresh.—Prairie Farmer.

POULTRY QUERIES.

Too Rich Food.

My chickens are dying. They become very light and lose appetite. No sign of bowel trouble. Crop almost empty. Examination shows liver to be a light yellow, almost like the lungs in appearance. Gall is exceedingly large. Have been giving small doses of calomel. Mrs. W., Imperial Valley.

From your description we would judge that you have either fed too rich food or some that may be musty, which may have caused indigestion and infection of the liver. Give complete change of food, using some well-known chick food, with plenty green stuff, charcoal and grit.

Give More Particulars.

What is the trouble with my pullets. They cannot stand, and wings are drooping. They eat all right. R. A. J., Corning.

Your description is too meagre for us to tell you the trouble. If you will write us fully what your feed has been and give us a better description of the pullets we will endeavor to give answer.

Possibly Was Injured.

We recently killed an apparently healthy young Plymouth Rock rooster and found a substance colored similar to the yolk of an egg about an inch thick and two inches wide, detached, but lying near the back. Please tell me what it was. A Subscriber, Santa Ana.

Your bird probably got hurt at some time, which caused the growth. We can think of nothing else that caused it.

Liver Trouble.

I have a valuable Minorca rooster whose comb turned black and his wattle swelled a half inch thick and he would not eat. I gave him a teaspoonful of castor oil and made small hole on the under side of him and a thin yellow fluid ran out. He got better and eats well, but there are white lobes and his comb is getting dry and hard. He has grain and plenty of alfalfa. A Reader of Many Years, Tulare.

Your bird has liver trouble, which is caused by feeding too rich food, or spoiled food. Also lack of charcoal. Change food, give a variety, with plenty of green vegetable food; also charcoal and grit.

ODDS AND ENDS.

TTER heritage than a work- knowledge of dairying can rdly be given to the younger on. I have been extensively is State as an institute wherever there are dairy the people have money to There are men always on tell how they started with ee or four hundred dollars w cows, after a few years of ned the land and the cows on dairyman, if he would count earnings and money invested s, would be surprised at the lary he has received during he had thought only of it as or his cows. Good cows are ble investment, poor cows all loss, if one knows what to them. Breed them to a good se the heifer calves and sell s fresh for as much as you them. There are people in hat want cows of limited that can be bought cheaply ned off to the butcher when milked out. Many a woman raising a bottle baby wishes w giving only a couple of gal- milk a day. She wishes to cow to milk for a six months ar and then if she has to sell utcher for ten dollars less t, she is well satisfied as the given milk enough for the d is off her hands.

Handkerchief Farms.

in Rhode Island where the shionable people congregate, by catering carefully to this eceives ten cents the year per quart for all the milk his e farm" can produce. At last s he had thirty-five cows and n on purchased food and was ell at the business. He cer- nderstands his business to do cessfully. We do not live up opportunities on the cheap al- elds of California. Alfalfa is t feed known. I was reading er day of the winter ration of H H. Dean of Ontario, gives for cows, it would California dairyman want to of business quick. Read this nder what a money value the inters have to us. Eight to nds of clover hay; 30 to 40 of corn silage; 20 to 30 pounds gels; eight to ten pounds of omposed of bran and oats, arts and one to two pounds of l, gluten or peameal. This is y's feeding. If the cows of nia received feeding like that ter of the State would certain- ncreased.

ans.

e the milk man is often for dirt, sometimes the con- is none to careful. I have an g little note on the desk t in by the wagon boy: call up Mrs.—— and tell her n is not clean this morning; two frogs in it and green These are milk customers uy five-gallon lots. The cook tly was careless in his work at ome.

is one of the foods that if the is done by the natural lactic bacteria is very wholesome. bacteria when unrestricted in their work are able to destroy the ptomaines produced by some forms of bacteria. The common forms of lactic acid bacteria are limited in this action. There is a form used as a ferment or yeast in Bulgaria to produce "Yog-hout" that has a distinct value as a cleanser of the digestive tract. These bacteria seem to sweep away the ptomaines completely. The Pasteur Institute over in Paris are investigating and preparing cultures for distribution. The Battle Creek Sanatarium people are also looking into the matter, as the drink of sour milk produced has a curative effect in all troubles that are intestinal. The very bilious people that find themselves constantly poisoned by foods can, by using Yog-hout, become healthy as normal people, as it destroys auto infection completely.

Koumiss.

This is another valuable production from milk in all fever and stomach trouble where milk can be used. We like it as a drink in the summer time. Take the morning milk and add to each quart a tablespoon full of active yeast and a tablespoon or more of sugar. Stand in a warm place and mix thoroughly. When evenly mixed and at temperature of 80 degrees, bottle into clean bottles, tie the cork down firmly, or better, use the bottles that have the iron clips for holding down the corks. Then stand the bottles in a rack upside down and in a place where the temperature will be not below 65 degrees or above 80 degrees; either too high or low temperature will kill the yeast germ that is working in the koumiss. After twenty-four hours put in a cooler place. Keep the bottles upside down; it is ready to use the third day, but will keep for two or three weeks; indeed, I do not know how long it would keep for it goes very quickly at the ranch. It foams and froths to fill half the glass and when just off the ice is very good. It is called milk champagne and is said to grow very alcoholic with age. The more sugar put into it the more alcohol it will develop by fermentation.

Ice Cream.

Rennet ice cream or frozen junket is familiar to many people, but it is not as good as the old fashioned buttermilk ice cream. This has become a fad with health seeking people. One part buttermilk to two parts plain sweet milk is well sweetened and flavored. In flavoring it the ordinary extracts used are not good, instead a cup of thick chocolate or of coffee or of maple syrup or of caramel, any one of these are better than even fruit. Peach preserve is not had in the way of flavoring.

New Process Butter.

The inventive genius is ever turning to devices for making butter; indeed, the new churns that are patented are almost enough to fill a book every decade, yet none have been able to devise any other way of getting a good butter out of cream that was better than the old way of concussion and shaking in out. The latest process to be received by a government bulletin, is the process patented by Sallie Boykin of Croket Co., Tenn. The process is simply making butter by Devonshire cream instead of raised cream. It will make a

FREE TRIP TO SEE THIS HAY PRESS AT WORK

LOS ANGELES AND RETURN AT OUR EXPENSE

WE PAY YOU TO INSPECT THESE HAY PRESSES.

Instead of paying a salesman's fare to show you a small model of a hay press, we will pay your fare to Los Angeles and return, not exceeding $15.00, to examine our California Special New Century, full circle, all steel, self feed Hay Press and all others on sale there. It makes no difference which hay press you buy, we pay your railroad fare just the same.

When you see for yourself how this machine has been built expressly for heavy baling on the coast, how strong it is, how easy it is on horses, what smooth bales it turns out, you will understand why we make such an offer. It has 7-in step-over, pull power, high baling chamber, positive plunger rebound; it stands up to its work, no taking off of wheels. Has record of 39 tons per day. We will ship you one to try. If you don't want it we will pay freight both ways. Write now.

ARNOTT & CO., 118 South Los Angeles St., LOS ANGELES, CALIF.

More Pork

Nature has provided the hog with great digestive capacity. It reaches full development and fit market condition in a few months' time. This fact, however, makes the hog an easy prey to indigestion or disease. When we consider the great increase in bulk and weight (often several hundred pounds) made in a season's feeding, we see the necessity for maintaining the digestive functions of the animal in a normal and healthy condition. Dr. Hess Stock Food, given in small portions twice a day in the regular feed, provides the necessary preventive of disease and the proper aid to a regular and *increasing* power of digestion.

DR HESS STOCK FOOD A TONIC

increases appetite in all domestic animals. Steers and cows eat more coarse fodder with the grain ration and digest the largest possible proportion of it, the manure showing by analysis a much lower per cent. of lost nutriment than that of animals differently fed. Dr. Hess Stock Food is the prescription of Dr. Hess (M.D., D.V.S.) and contains iron for the blood and nitrates to cleanse the system. Professors Quitman, Winslow and Finley Dun, our ablest medical writers, recommend these ingredients for producing the results claimed. Makes cows give more milk and steers lay on fat. Gives good condition to everything that eats it. *Sold everywhere on a written guarantee.*

100 lbs. $7.00; 25 lbs. $2.00

Smaller quantities at a slight advance.

Where Dr. Hess Stock Food differs in particular is in the dose—it's small and fed but twice a day, which proves it has the most digestive strength to the pound. Our government recognizes Dr. Hess Stock Food as a medicinal compound, and this paper is back of the guarantee.

FREE from the 1st to the 10th of each month—Dr. Hess (M.D., D. V. S.) will prescribe for your ailing animals. You can have his 96-page Veterinary Book any time for the asking. Mention this paper.

sweet milk flavored butter and for warm climates has some advantages. Where only a pan full of milk is to be used it can be handled with sufficient economy to be profitable in saving labor. The pan of milk is set in the usual way in a cool place, the next morning without disturbing the cream, the pan is placed in another pan containing water and put on the range to arise to a warm temperature gradually. When the cream begins to wrinkle a little, stand the pan off the stove and let it cool down. When cool the cream should be leathery, then run a hand flat bladed knife under the cream and turn it over and over in folds like an omelet. Then take it up with the whipping bowl. If it is desired it can be eaten on bread just as it is, or it can be made into butter by using a beater. The butter will come in five minutes, if the cream is chilled to forty-five degrees. This butter will lack in grain a little and be low, mild, sweet flavored like pasteurized butter that has not had a heavy dose of culture to flavor it.—M. E. Sherman.

WHITE SCOURS.

This is a violent and deadly diarrhea that attacks young calves during the first few days of their life. If a calf escapes the disease for a week or so it is practically out of danger. White scours is due to a germ that usually enters the system through the freshly torn navel cord. When a calf is born the blood vessels and membranes extending from its body to the membranes attaching it to the uterus of its dam break and leave a fresh wound on the end attached to the calf, and this, if it comes in contact with infected bedding or manure, is sufficient to cause the disease. Even the hips of the cow afford a means of infecting the calf. White scours is frequently observed in herds where contagious abortion exists; this has led some authorities to believe that the same germ produces both diseases, but this theory has never been strongly supported, in fact, many things indicate that there is no connection between the two other than that both are fre

pharynx. In the latter situation they are often difficult to reach, but may be snared with the aid of a mouth-gag and a thin metal tube and piece of stout wire.

With the exception of those cases, by far the best results are obtained by medical treatment, potassium iodide being a specific for the disease in cattle. The dose should be regulated according to the size of the patient, and should be about 1-4 of a drachm for each hundred pounds body weight—that is, from 2 to 3 drachms, once daily. It is best given dissolved in about a pint of water and drenched, in order to insure the animal getting the whole of it. After four or five days or a week the animal may show signs of iodism in the form of diminished appetite, catarrh of the nasal muscous membrane and conjunctiva, and the feces may be dry and coated with muscus. The potassium iodide must then be stopped for two or three days. During this interval 4 grains of biniodide of mercury may be given with advantage, as the growth otherwise increases somewhat when the iodide is stopped.

Biniodide of mercury is sometimes used throughout as a substitute of potassium idodide; the daily dose should be 3 or 4 grains dissolved with the assistance of 10 grains of potassium iodide, and administered as a drench in a pint of water. Although fairly good, it is slow in action, and its effects are not so generally satisfactory.

When there is ulceration or abscess formation, these conditions must be treated accordingly, by curetting and syringing, or packing the cavities with wool saturated with iodized phenol or Lugol's solution. Law suggests that where potassium iodide fails in cases with purulent complications, injections of antistre tococcic serum may be used with advantage. He also states that good results may be obtained by injecting potassium iodide solution twice a week into the tumor instead of giving it by the mouth. Some veterinary surgeons scarify the tongue and rub in biniodide of mercury ointment. Others apply strong nitric acid to the wens, and claim very good results for it. The last two lines of treatment appear to the author, however, as being both barbarous and unnecessary.—

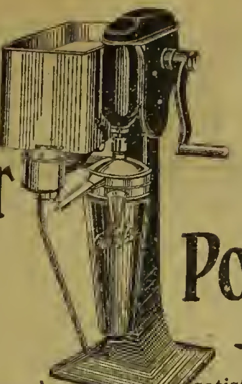
HOW TO EXAMINE A SICK ANIMAL.

First take the temperature of the animal by placing a self-registering Veterinary Fever Thermometer into the rectum, allowing it to remain there from three to five minutes. The normal temperature of a cow is 101 degrees (Fahrenheit) and the normal temperature of a horse is 100 degrees (Fahrenhelt;) hog 100 degrees; sheep 101 degrees.

Second, take the pulse of the animal, which can be found at the angle of the lower jaw bone. The normal beats of a cow's pulse is from 40 to 50 per minute and that of a horse is from 33 to 40 per minute.

Third, count the respirations of the animal, or number of times it breathes by watching the sides of flanks, or by pressing the ear to the side. The normal respiration of a cow is from 15 to 20 per minute and that of a horse is from 12 to 15 per minute, while resting.

If the temperature, pulse or respiration are found to be higher or faster than above described, you will know that the animal is ailing.—Dr. David Roberts, Wisconsin State Veterinarian.



The Tubular Separator Leads All in Popularity

Popularity means users' satisfaction.

Satisfaction includes efficient service, easy operation, increased profits—that the Tubular does better for users than other separators.

Not what words may say makes these conditions true. What the Tubular does in the dairy is the basis and proof of our claims.

Dairy tests tell—you can make a test.

We arrange for proof, so that dairymen and dairywomen may be assured in advance of these facts; so they may know what a Tubular will do for them in their dairies.

Here are our claims of what the Tubular is and does:

Cleanest skimmer of any separator made
Easiest to Handle **Least Weight to Turn**
Most Convenient Supply Tank **Most Economical to Run**
Simplest in Build **Most Durable in Use**
A Stranger to Repairs **Economizes Oil and**
is miles ahead of any other in easy cleaning.

Many differences you can see with your eyes.

Other differences we are ready to prove.

Catalog free, telling scientific and mechanical reasons for Tubular difference from and superiority over other separators. Ask for No. 260.

But seeing the Tubular is still better. Write and ask us to tell you about it, where you can see it, and how you can prove for yourself what Tubular Service will mean for you and for your dairy, right at home.

Malthoid Roofing

Mr. W. T. Somes, Proprietor of Bimini Hot Springs Hotel, Los Angeles, Cal., U. S. A., writes as follows: "Our hotel building, a flat roofed structure covered with Malthoid Roofing, is situated quite near the large Bimini Bath Houses that burned so fiercely the night of November 15th. The wind carried the blazing shingles and red hot cinders in showers to my building, where they simmered on the Malthoid Roofing and went out, doing no damage beyond a number of small blisters raised on the surface of the roofing. We have had one rain since the fire and the roof is tight."

Gophers.

For the benefit of those troubled with gophers, I send you a plan that I use for wholesale poisoning. I use a small shovel plow, make a trench five or six inches deep, drill poisoned Egyptian corn in the furrow and fill up the trench with dirt. It is all that is necessary to do; if the corn goes near a gopher den they will find it. I arranged a shovel for the purpose by attaching a large funnell to the handles just over the beam. Let a short piece of rubber hose go from the funnel down and lie close up against the rear side of the shovel so that corn dropped in the funnel will be discarged in the furrow and as the dirt falls in behind a narrow shovel the corn is covered.

In any but fresh plowed ground this does not work. If the ground is not rained on after plowing, I would advise waiting for a rain or irrigate the land to settle it before using the poison as the gopher can't readily follow the corn drill if all the ground is loose.

I will give the dose I use for five gallons of Egyptian corn. I get $1.50 worth of strychinine and for good measure I put in a box of rough on rats; dissolve the poison in enough sweetened water to soak the corn. When near the sprouting state give to the gophers.

Gophers, as a rule, are somewhat in colonies and it is necessary only to run the corn all through back and forth where they are then move to another spot.

Any one not wishing to fix up a shovel can use a small turning plow. Drill the corn in by hand and use the plow to throw back the dirt in the furrow. Don't worry about the gopher not finding the corn. If not killed he will get every grain put in a narrow trench. Drill the corn so that there will be a break of but a few inches in the corn. I find January and February the best time to poison as they are hard up for food.

* * *

I would like to correct some one answering a subscriber as to the advisability of budding or grafting peach to apricot stock. The writer stated in your paper that the two would not make a good union and the tree would likely be lost as soon as a heavy crop of fruit or a good wind came along. I can say positively that the opposite is a fact. I have 25 acres of old trees and many good crops of apric come off them in the last 1 not a tree has parted at the have made firewood of a goo and cut through the union an ined the chips closely and find the union perfect.

In the case of the peach ar on apricot I know they will n a good union for I have see part there, just as the two h an acorn, without a splinte serymen don't like to work stock, because it is easier t the peach. I know that a p chard on apricot root is f lived and will do better on heavy soils than will the p —C. A. McDermott, Sultana.

Mildew on Onions.

Will you kindly tell m the Cultivator what disease Bermuda onions which is in C. Toyoshima.

The onion disease of wh correspondent sends a spe that known as the "mildew," tacks the onion very severel State during the winter seas disease is particularly troubl the growers of onion see fields often become badly with mildew. Spraying with deaux mixture has been tr some success for this disea not effective unless the work particularly well and thorou account of the smooth leaf s the onion plant. It is quite to make the spray stick leaves and cover them co In spraying for this disease to add two or three pounds o fifty gallons of Bordeaux m order to make the liquid st evenly. It must also be app very fine misty spray, obt getting a high pressure f pump.

In our climate the applica sulphur is often very effectiv troubles of this sort, and I w ommend the enquirer to try t sulphur should be dusted plants quite abundantly, put in the morning when the to with dew.—Ralph E. Smith

Possibly Blight.

Wilting and dying of w plants; hills of six, eight plants will wilt and die gra til they are all gone. It is cut worms or lack of m have examined them caref casionaly find a wire wo the roots and I also find tha of the stems is a kind of a rusty color just above where roots begin.—E. C. R., San

I have not had a case this in my experience, and further data than is suppli query it would be difficult mine the cause of the troubl had squashes destroyed in ner by a worm or maggot th within the stem. If on caref nation of the interior of nothing can be found, I shou clined to believe the troubl by some fungus in the soil gret that I can offer no re A. L.

Isn't this a case of bligh only a change of soil locatio voting this soil to culture ll avail. Melon growers near geles are compelled to change every two or three years, for as the blight strikes there is hope for the land till. other ve been grown.—Ed.

Many planters grow lants two years before setting manent quarters. It never to me to be the best way, if it ible to get first class one-year Asparagus is one of the rank- ders known among vegetables is labor thrown away to at- to grow it in any ordinary soil t liberal fertilizing, and expect ble results. It is, moreover, a at is good for 20 or more years erly cared for and will, there- ay for some extra work in preparing the soil. One hundred tons per acre of good stable manure is none too much to work into the soil before planting.

A great diversity of opinion exists among gardeners as to the distance apart to plant. I prefer rows that are four feet apart with a plant set every 18 inches in the row. Let the crown of the plant be about four inches lower than the surface and cover about two inches when planted and after growth starts fill in the balance. There should be an annual application of manure about February 1st and at the same time sow kainit at the rate of 600 pounds per acre. It is best not to cut any asparagus for the first year after setting out the plants. For the beginner, or any one with limited means who wishes to grow asparagus, it is wise to begin in a small way and do only as much as can be done thoroughly. By pursuing this course every year it may take longer to get your desired area, but it is the only desired course that will bring success.—Q. A. I.

To Kill Johnson Grass.

I have noticed several queries in regard to killing Johnson grass. I have found that it can be killed by covering with 18 or 20 inches of manure. Leave it for one season. I have tried this successfully.—O. C. Woodward, Chico.

We thank Mr. Woodward for the suggestion and believe the treatment will be effective and, more, will leave the soil in fine condition. Along this line we may note that we recently noted that another has secured good results by covering the ground with roofing paper taken from a farm building. It was laid over the grass so as to exclude light and air as much as possible.

Eucalyptus for Wood.

Kindly inform me through your columns as to the right kind of eucalyptus trees to plant for the production of wood. Also inform me as to the distance to plant trees apart, amount of water required and the necessary cultivation. I have two kinds of soil, red clay and sandy loam. What I want is a quick maturer and a large producer, something marketable in three to five years.—D. L. A.

We do not think you will find anything superior to the common blue gum, Eucalyptus globulus. It has been dubbed "the Prince of Eucalypts" and is the fastest grower of any tree. Once established it will withstand drought and quite low temperature, but when young does not like a continual temperature of much below 27 degrees. You would need to water the first year or two. If watered abundantly thereafter, more abundant growth will be given. In that case a cutting of wood may be had in five years. Some have planted as close as 6x6 and in three or four years cutting each alternate tree out. Probably 8x16 feet is better and will give as much growth and better timber.

Arid Farming.

Kindly inform me through the columns of the Cultivator how to obtain a general knowledge of the Campbell system of dry farming, and oblige.—H. L. Dodge, Stockton.

Any questions you may ask "Dry Farmer" will be answered in the Cultivator. Dry or arid farming is not a system which any one has a patent or exclusive knowledge on If, however, you wish information from Mr. Campbell, you can write him.—H. W. Campbell. Lincoln, Neb. He has published a book we believe at $2.50.

Orange Marmalade.

Enquirer for orange marmalade will find recipe in issue of Feb. 27, page 244. Also if lemon and grapefruit recipes are desired, see issue of Feb. 13, page 181.

Classified Liners

Rates 1½ cents per word per issue. No ad accepted for less than 25 cents. Our classified columns are the clearing house for the readers of the Cultivator. Here you can insert an ad for the small sum of 1½ cents per word per issue, and be sure that it will be read by thousands.

FALLING LEAVES.

The days are shorter, 'tis chilly weather,
The hours are swiftly flying,
The winds go rushing through the trees,
Their leaves are dropping, dying.

O, beautiful in death are they,
The autumn leaves all crimson,
Yellow, brown and the shades between,
And others speckled and golden.

I cannot explain the sadness that comes,
When the wind with its mournful sound,
Unloosens the leaves from the friendly trees,
And with zigzags float to the ground.

In the heart of all will this pain attend,
Who with thought doth witness this fall,
Conscious of weakness, lonesome, yearning,
While mystery covers all.

U. U. J.

THE GIRL HE LOVED.

Continued from last week.

It was not a stylish hotel; it was a plain, old-fashioned place, and its customers were of the same sort.

There was some flutter when Mrs. Acton's carriage stopped before the door, and the lady was shown into the parlor. The landlord presented himself promptly; to him Mrs. Acton was condescendingly affable.

"I have come to speak to a young woman you employ here," she said; "one Mattie Morley. Can she come to me for a few moments, Mr. Borum?"

"Certainly, certainly," the man replied, in some surprise, "I'll send the girl to you."

And he hastened away and was heard calling in the distance:

"Mattie—Mattie, where are you? You're wanted, girl—you are wanted."

Mrs. Acton began to feel a little nervous; she felt more so when she looked up and saw a charming girl standing in the doorway. Beauty she had expected, but such a face, such a mein. The girl did look like a lady she confessed to herself. Phil was right.

"I am Mattie Morley, madam," said the young woman. "You wish to speak to me?"

"Yes, my dear," said Mrs. Acton, "I do. Shut the door, and come here and sit where I can speak to you without being overheard."

The girl obeyed.

"I am Philip Acton's grandmother," Mrs. Acton said when she had done so. "Philip has told me of your engagement to each other. Now I have no personal dislike to you. You are a very pretty girl, and are, no doubt, well thought of by your friends. But I do not wish Philip to marry for years and years, and if he does—any one, you know, not you particularly—he will have to go away from home and earn his living as he can. If you have any friendship for him you will not condemn him to that. He is not accustomed to work, and will never be able to support himself. And of course a wife would have a hard time of it. You would lose what you have and gain nothing. I should leave every cent elsewhere. I never say a word I do not mean.

"Of course, a girl should marry as well as she can," proceeded the old lady, trying to look benevolent, "and my object in coming is to save you from doing a foolish thing; any honest young man who can work at a trade

would be a better match for you
an idle young gentleman with n
in his pocket. Besides, he will
able to stick to this idea of hi
it will be better for you to be th
to break off the match. As a w

have let it go at that; but I was christened Mathilde, and my father's name was Morelli."

"Great Heaven!" cried Mrs. Acton. "Child, tell me your mother's name?"

"It was Grace," said the girl.

Mrs. Acton had turned pale and was trembling violently.

"Have you anything that once belonged to your mother?"

"I have this locket" she said, drawing a square ornament of gold from beneath her coarsage. "It holds the hair of my grandparents. It was about my neck that fatal night, and so has been preserved."

Mrs. Acton caught the locket in her hand and opened it. A curl of gold, and another of ebon blackness lay within, and "To Grace, from her mother" was engraved upon the case.

"Great Heaven! cried the old lady. "This is like a dream. Child, your mother was my daughter. You are my grandchild. Philip is your cousin. Come to me."

The next instant she was weeping upon the girl's shoulder.

"Come home," was what she wrote to Philip next day. "I have made a discovery. Mattie is your cousin, and I see no reasons why cousins should not marry?—Mary Kyle Dallas, in Journal of Agriculture.

RECIPES.

To make paste for pork pies put 1 lb. of flour in a basin, and well mix into the flour 1 oz. of salt. Melt one-quarter lb. of either lard or butter in one-half pint of hot water.

As soon as the butter is melted make a hollow in the flour in the basin, and with the lard make the flour quickly into a nice elastic dough; put it at once in a warm basin or saucepan, cover it with a cloth to keep it warm until you are ready to mould it into pies, which should be about the size of a small plate, and quite three inches high. These are raised by making a piece of the paste into a ball, and moulding it round a small basin or jar, keeping the paste of an even thickness all through.

Pare off the rind and some of the fat from any parts of pork that you wish to make into pork pies; cut the meat in scollops, and well season the pork with a seasoning—all well pounded and passed through a fine wire sieve—of 1 oz. of bay leaves, half a nutmeg grated, 1 oz. of cloves, one-quarter oz. of mace, 1 oz. of basil, 1 oz. of winter savory, 1 oz. of lemon-thyme, one-quarter oz. of cayenne pepper, one-half oz. of black pepper. 2 cloves of garlic, and one-half oz. of grated lemon-peel. These herbs can be kept for use well corked down in a glass bottle. Not more than a dessertspoonful is required for each pie, with a seasoning of salt to taste.

Pack the pie firmly with the meat; use but a very small quantity of water—not more than two tablespoonfuls; put on top, pinch the edges and bake in a moderately hot oven for two hours. They can be ornamented with the paste, cut in leaves or any fancy pattern. When taken from the oven, a little good, well-flavored gravy—not dark—should be poured in at the top. They are best eaten cold, and will keep good for a week or ten days.—London Farm and Home.

HOMELY HINTS.

Scrape the bread board thoroughly with a table knife each time after using and rub with a clean, dry towel—do not wash it. Treat the rolling pin the same.

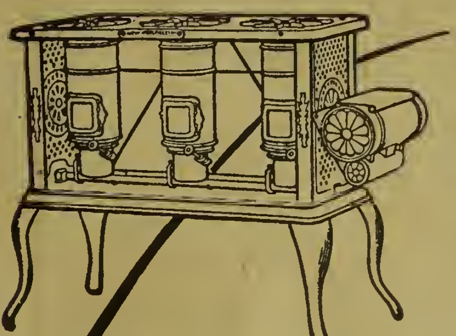
Hot Stove—Cool Kitchen



How do you expect to endure the broiling days of summer if you prepare all the food over a glowing coal fire?
You need a "New Perfection" Oil Stove that will do the cooking without cooking the cook. It concentrates plenty of heat under the pot and diffuses little or none through the room. Therefore, when working with the
NEW PERFECTION
Wick Blue Flame Oil Cook-Stove
the kitchen actually seems as comfortable as you could wish it to be.
This, in itself, is wonderful, but, more than that, the "New Perfection" Oil Stove does perfectly everything that any stove can do. It is an ideal all-round cook-stove. Made in three sizes, and fully warranted. If not with your dealer, write our nearest agency.
The Rayo Lamp a substantial, strongly made and handsome lamp. Burns for hours with a strong, mellow light. Just what you need for evening reading or to light the dining-room. If not with your dealer, write our nearest agency.

DON'T THROW MONEY TO THE PIGS

The mine owner gets his gold mixed with rock and combined with other metals. He gets out all the gold and then makes in addition what he can from the lead and silver, the "by-products."

The dairyman's gold is cream; the skim-milk his principal "by-product." To get all the profit he must use an

IMPROVED 1908 U.S. CREAM Separator

With this Separator he gets out all the cream, and then uses to best advantage the skim-milk. He can't afford to feed cream to pigs.

Our Catalogue No. 20 tells why. Let us send you one.

The Produce Markets

Los Angeles Markets

LOS ANGELES, April 29, 1908.

Quotations on butter are as last week, though a 2½ cent advance on quotations is demanded by many dealers. The market is not strong, however, owing to immense receipts cold storage is taking much of the present receipts.

Creamery ex per roll	47½

COULSON'S
CRESOLENE

Lice Killer Disinfectant and Dip

❋

Dilute With Water Before Using

❋

CRESOLENE is a powerful disinfectant, insetcicide and germicide obtained from coal tar. It is non-poisonous, and non-corrosive and will do no harm to the most delicate skin.

It mixes readily with water, forming a milky emulsion, and can, therefore, be diluted from 50 to 100 times its own bulk, in accordance with the different uses to which it is put.

Thus when you purchase 1 gallon of CRESOLENE you can make up to 100 gallons of the best disinfectant at a cost of only 11-4 cents per gallon. Write us for particulars and guarantee.

PRICES: Quart can 50c; One-half gal. 85c; Gallon $1.25.

operahouse, perhaps 75, surely not more
00 people.

Commissioner's Address.

Commissioner Jeffrey in his annual address centered largely on one point rather than covering a large range of horticulture, as has been the custom in the past. It was more particularly an appeal for recognition of the fruit industry of the State by our legislature in making greater appropriation for its advancement. He called attention to the fact that:

"For the fiscal years 1907 to 1909, the State Agricultural Society secured for maintenance and buildings, $87,500, and for the State Fair $5000 and the gate receipts. The Dairy Bureau was given $11,100. For cereal improvement, $10,000 was appropriated and for tobacco culture $1000. These items foot up $114,600 appropriated by the last legislature almost exclusively for the advancement of the interests of the grain and stockmen. For the same fiscal years the State Horticultural Commission was given $35,000 for support and $12,000 for the insectary building and parasitic search. There was certainly no discrimination here in favor of the orchardists, for these figures show that the farm and stock industries were granted more than three dollars for every dollar appropriated to the promotion and protection of fruit growing. Neither were other landed industries, nor the outdoor sporting interests neglected, for the same legislature voted $51,000 for the use of the State Mining Bureau and $87,500 for the Fish Commission. Summing up these items we find $253,100 were voted to the field, mining and inland fish interests, as against the $47,000 devoted to the work of the State Commission of Horticulture is expected to do in the promotion and protection of an industry which has done more for the State than any other enterprise. We should sit in admiration at the feet of these interests. and while applauding their success in securing funds, learn of them how all things come to those who do not wait."

CACTI IN WHITE PARK, RIVERSIDE.

The committee appointed to consider the commissioner's address consisted of J. H. Reed, Geo. C. Roeding and C. E. Beemis, later reported favorably to taking steps to bring about the recognition of the best interest of the fruit grower by the State legislature and securing a more liberal appropriation to conduct its work.

The welcome by the mayor was a most fitting address and indicated the warmth of the reception to the members. In the absence of Gov. Gillett, Hon. Miguel Estudillo quoted Bryan as saying that "a farmer was a man who makes his money in the country and spends it in the city, and the horticulturist was a man who makes his money in the city and spends it in the country."

Secretary Isaac reported having taken up the resolutions passed at the Marysville convention having forwarded all such to the proper senators, representatives or heads of departments at Washington, and at some length read answers received.

One suggestion made by the convention did not meet with favor and was not acted upon was the endorsement of Dr. Wiley, head of the Bureau of Chemistry, and who has charge of the enforcement of the pure food law. While there can be no question that many of his acts are most heartily endorsed by parties who were attending, it was felt that the great injury done the industry of this State was such that endorsement at this time might be misconstrued, and the matter was allowed to drop.

The discussion of walnut blight and handling by Mr. Neff and Prof. Ramsey, was very interesting though does not apply to local conditions so much as did some of the discussions that followed it relating to the citrus fruits. The paper by Mr. Neff was given in last week's Cultivator.

A New Plan.

An effort was made in the program to change the former plan of conducting the meeting by allowing more time for the discussion. Some of these discussions were very helpful and conducted as the committee had planned. That is, one representative grower appointed to lead in the discussion directing others whom he may have previously selected to bring out the salient points which had been touched upon by the original paper. Some who were selected as leaders of the discussion apparently misunderstood this and followed with a long discussion or paper of their own, which took up the time allowed for the entire discussion. The best part of these conventions is always that devoted to the discussions from the floor of the house. There was but little of this at this convention.

Citrus Day.

Wednesday morning brought out representative attendance from all citrus section. The interest centered around the discussion of handling citrus fruits from orchard to the car. Messrs. Reed, Powell, Rumsey, Dreher, Chapman and others were present and entered into the discussion most fully. Like the lecture by Bob Burdette on "The Rise and Fall of a mustache," which, we believe, is never mentioned in the lecture, Mr. Rumsey spoke about packing-house equipment with nearly everything about equipment left out. This paper will, however, with many others not treated more fully, be given in a later Cultivator.

Mr. Elbert Lyon spoke on the Citrus Protective League, an organization of the entire industry. This organization has been formed slightly more than a year, and its work is the handling of such problems as tariff, rates with the railroad, securing prompter service, and other such features which may not be handled by the grower or shipper. It is supported by an assessment upon all associations which care to put into its treasury the sum of 10 cents on each car of fruit.

C. C. Chapman of Fullerton endorsed the league and urged its heartiest support by every fruit grower in the State. Railroads are recognizing the league and the fact that it is a representative one, and in touch with the entire citrus industry.

Continued on Page 526.

With the Citrus Growers

BUDDING ORANGE TREES.

THE active season for budding over orchard trees of various ages and sizes is now at hand, and as many trees are being worked over into new varieties or better strains of the same kinds. This latter operation is not so common as it used to be. Australian navels are not much in evidence now as they have been converted into better varieties. Many orchards have continued to bear a poor quality of fruit even though they are Washington navel and they might be profitably converted into a better strain of the same or else the now famous California Valencia.

A little over a year ago, Prof. Wickson addressed the orange growers of California on new varieties of oranges desirable for California. He stated that several years ago that there might be named four or five varieties of oranges that were considered desirable and in demand and they could at that time be obtained from the nurserymen in quantities, but today there are but two that are planted in commercial quantities. They are the Washington navel in its various types and the Valencia.

Mediterranean Sweet is an excellent late variety and brings good retruns per box, but there are many localities in which it is practically barren. Unfortunately for these cases, this variety is very difficult to successfully bud to other varieties during some seasons, and many failures have resulted.

The indiscriminate collection of buds for nursery trees has lowered the profits of many a grower far below what they should and might easily have been. Happily, this part of the growth of the citrus business has been nearly eliminated or passed and the intelligent selection of buds is insisted upon by all careful observers who have interest in the matter. One citrus grower of Southern California at one time had occasion to need some young trees and advertised for pedigreed stock and fortunately found some grown by a man who was particular on the same point and whose reliability was always unquestioned. He received more than double the usual price for these trees than was asked for straight nursery stock of the usual grade. While this was a typical example that all growers should live up to, at that time it was an exception, for one nurseryman in the same district had carefully selected buds from trees that produce a large percentage of prime fruit and had budded part of his stock to this. He failed to realize on these for the trouble and extra expense he had incurred, planters actually buying trees from stock grown from buds gathered promiscuously, because they were a few cents cheaper. This showed that some nurserymen were more progressive and alive to the best interests of the growers than the growers themselves, as a whole, proved to be. This condition will not hold as it has in the past, as the prospective planter has the advantage over those of the past, in that he is being educated along these lines by the initiated and the horticultural press. Information along this line was not obtainable a few years ago unless the prospective planter happened to hit upon those who had the advantages of experience and observation. Now the great majority of growers are awake to the importance of the matter and the novice can be reassured from many quarters that it is important to have pedigreed stock. By pedigreed stock we do not mean that which has been traced for several generations of trees, but buds from trees that have proven superior to the great majority of trees in the best groves. As an instance of what is liable to happen and has evidently happened in the past, we know of a Riverside orchard that was grown from the seedbed by one of our most careful and systematic men and a veteran nurseryman. The grove, which comprises something over 100 acres, was planted from selected buds, but scattered through this grove were a number of trees that produced inferior fruit and not up to standard in quantity in many cases. There were also many trees that are producing fruit that will run almost 100 per cent fancy and bear abundantly. The poor trees have all been rebudded. Had a nurseryman taken buds from this orchard promiscuously, there are many chances that he would have produced a mixed lot of nursery trees, while if buds were selected from the best trees in the grove, the chances for even a few inferior trees would have been remote.

During the craze to convert seedling groves into navels and even navels into Valencias, many mistakes were made that have proven costly. Some of the finest seedling groves, trees that would have paid better than anything which they could have been converted into during the life time of the owners, have been budded and cut off. There are still some handsome seedling groves that are the envy of some of the growers who have budded trees. In another generation, these magnificent trees will be the pride of the South.—J. W. Mills.

The California Lemon

Delivered at the 34th State Fruit Growers' Convention.
BY C. C. TEAGUE, SANTA PAULA.

PERHAPS no horticultural business in the State has made advances during the past few years as has the lemon business. Only a few years ago, the California lemon was in bad repute in the markets of the country on account of its poor keeping quality. This was largely due to ignorance on the part of the grower and shipper as to proper methods of growing, handling, curing, and packing, but as greater knowledge has come, the reputation of California lemons has steadily grown, until now the established brands are sought after in the markets where they are known, at prices considerably better than the best grade of foreigns. As the supply of good California lemons has increased, the Mediterranean lemon has been forced out of the West and Middle West markets, and its market is gradually narrowing in the Eastern and Atlantic States.

Overproduction.

The question that many growers are asking themselves is, "Is there danger

ccess?

Location.

Careful selection of location is very important. It should be as nearly frostless as possible. I believe that the sections ranging from 20 to 25 miles from the ocean are best adapted to lemon growing, just as the warm inland sections are best for the orange. These coast sections grow a much higher percentage of summer lemons, and the fruit is harder and firmer, although the inland section probably grows smoother fruit. The business, however, is being successfully engaged in, in the inland districts.

Soil and Water.

Care should be taken in the selection of the soil. It should be loamy and well drained. Adobe soil is not suitable on account of the liability of the tree to gum disease.

A good supply of pure water, comparatively free from alkali, is necessary.

Stock and Variety.

The selection of the stock for planting is important. If the soil is loamy and well drained, trees budded on sweet stock will do very well, but if it is very heavy, or the grade of the land is so slight that good drainage cannot be had, by all means plant sour stock, as trees budded on the latter will be much more resistent to gum disease under unfavorable conditions. The buds should come from prolific trees, producing good fruit. The Eureka and Lisbon have stood the test of time, as being the best suited to California conditions. The Eureka begins bearing earlier, produces more summer fruit, gets its fruit to size greener, and perhaps is the favorite with the average grower. The Lisbon, on the other hand, is a fine variety. It grows much larger, is hardier, more resistent to frost, the fruit smoother, and produces well as it grows older.

The tendency of the lemon tree is to grow sprawly. It should be pruned so as to grow compact and full of fruit wood and able to bear the tremendous load of fruit which it has to carry almost throughout the year.

The grove must be kept well irrigated, and in an even state of growth. This insures a smoother, better quality of fruit.

Thorough, deep cultivation is important throughout the summer months. If deep cultivation is practiced when the tree is young, there is no danger of injuring it by deep plowing or cultivating as it gets older.

Cover cropping should be practiced as the cheapest way of keeping up the humus content and good mechanical condition of the soil and of supplying nitrogen. As the tree gets older, it must also be fertilized, as it is impossible to gather from fifteen to twenty-five tons of fruit to the acre each year, and continue doing so without returning something to the soil.

Fruit Care.

Improper picking and handling of fruit is perhaps responsible for more bad results than any factor. If time and experience have proven anything in the lemon business, it is that the fruit must be carefully handled. It should be picked in as green a state as possible, and still get the size demanded by the trade. Advanced maturity—in other words, ripe lemons—means weak fruit and decay. Decay means red ink.

Study the Bugs.

The grove must be kept from insect pests, in order that it may be vigorous and thrifty. This can only be done by

TREE TANGLEFOOT

A Sticky Preparation Applied Directly to the Bark of the Trees

Will not injure trees. A band 5 inches wide and 1-16-inch thick cannot be crossed by any climbing insect pest. Remains sticky five to ten times as long as any other known substance. You can test it at slight expense, as no apparatus is required. Used by the carload in New England against the Gypsy and Brown-Tail Moths. In California it preserves prune orchards from the Canker Worm Wherever the Gypsy or Brown-tail Moths, Tussock Moths fall or Spring Canker Worm or Web Worm appear TREE TANGLEFOOT is of great value, and should be used when the caterpillars begin to crawl while they are very young.

Price 25c per lb. Liberal discount on quantities. The only safe and effective banding preparation. Send for testimonials.

THE O. & W. THUM COMPANY

Manufacturers of Tanglefoot Fly Paper Grand Rapids, Michigan

Sulphur Your Vineyard

But see us about the Sulphur. We have just received from France 1000 kilos First and Second Grade, but both are sublimed and free from any particle of grit.

No. 1 is the best for ***Bleaching,*** where it is necessary to burn it, but it must be used cautiously for dry spraying.

No. 2 is the best for ***Dry Spraying.***

FREE TRIP TO SEE THIS HAY PRESS AT WORK

LOS ANGELES AND RETURN AT OUR EXPENSE

WE PAY YOU TO INSPECT THESE HAY PRESSES.

Instead of paying a salesman's fare to show you a small model of a hay press, we will pay your fare to Los Angeles and return, not exceeding $15.00, to examine our California Special New Century, full circle, all steel, self feed Hay Press and all others on sale there. It makes no difference which hay press you buy, we pay your railroad fare just the same.

When you see for yourself how this machine has been built expressly for heavy baling on the coast, how strong it is, how easy it is on horses, what smooth bales it turns out, you will understand why we make such an offer. It has 7-in step-over, pull power, high baling chamber, positive plunger rebound; it stands up to its work, no taking off of wheels. Has record of 39 tons per day. We will ship you one to try. If you don't want it we will pay freight both ways. Write now.

ARNOTT & CO., 118 South Los Angeles St., LOS ANGELES, CALIF.

The Fruit Growers' Conver

Continued from page 523.

Secretary Kendall was also present, and spoke on the lines of work touched upon by the other speakers, and referred to the fact that in a case such as the white fly pest and other features which require united action of the entire industry, the league would be one of great strength. He suggested that in case of a revision of the tariff every effort should be made by the orange grower to secure an increase in the present tariff of one cent per pound.

Mr. Teague's address on "Handling California Lemons" may be found on the citrus page of this issue. Mr. Allen of San Diego, in discussing the paper, spoke of the report which was at one time general that California lemons are much poorer keepers than the imported lemon. This evil report, which gained credence with eastern buyers and California growers, not understanding the proper handling of the fruit, caused many trees to be rebudded to oranges and lessened the output. He felt that the time has now come when competition will necessitate curing and shipping of only the best fruit, and that this will give the California lemon a different standing than it heretofore held.

Diseases of Citrus.

Mr. LeRoy in handling the discussion of Prof. Smith's paper on health and disease of citrus trees did so very much as anticipated by the commissioner and the committee in arranging the program. Messrs. Koethen, Paine, Mills and Bishop joined in the discussion, which was summarized by Mr. LeRoy. One or two points brought out were that puffing of oranges might be induced by irregularity of irrigation. A tree once suffering from severe drouth is liable to give puffy fruit after a heavy irrigation. Die back of the orange may be reduced by spraying with a weak solution of Bordeaux, 4:4:80 being the formula use. Gum disease came in for a most thorough discussion, and the almost universal belief is that it is not contagious, and that it is from a constitutional condition of the tree induced by improper soil conditions. However, the point as to its being contagious taken by some was that so long as it may be contagious, take advantage of the doubt and prevent its spread so far as possible. It was almost universally conceded that sour stock where budded above the ground made the tree almost immune from foot rot.

State Farm.

Prof. Wickson gave an interesting talk as to the work of the State Farm at Davis; also referred to the opportunity of obtaining great good for the farmer at the laboratory at Whittier and the citrus station at Riverside. He referred to the delay in getting the buildings in working condition at Davis, and that it was due to conditions over which the management had no control, such as contractors failing to carry out contracts, also non-arrival of appliances expected to put various departments into working condition. He exhibited a chart of the farm and the location of the creamery, seed houses, pavilions, dormitories, etc. He said there had been no effort to provide expensive or imposing buildings, but all buildings had been constructed at moderate cost, and every effort was made to so fit them as to be as nearly perfect as possible.

County Commissioners' Day

Thursday was almost enti over to the work of the var ty commissioners and papers infection work. Prof. Woglu some length of his investig the hydro-cyanide acid gas t and referred to his efforts to some method by which a dosage could be given trees sizes. He said the great was in securing a man w h judgment to estimate th n cubic feet in a tree. Such born, not educated, for i sible for any one who cann ition estimate the amount of c required to give the requi without liability of injur trees, or of not killing with a dose. Mr. Maskew led in sion, calling upon Mes Goodrich, Canfield, Peas Bremner and others to aid cussion. In discussing th between red and yellow sc ple was presented to the or commissioners, on the and some declared positiv to be true red scale, oth with equal positiveness tha yellow scale. Doctors disa the members of the conven air as to the real differenc red and yellow scale.

One point brought out in cussion was that contracto against each other was one inferior fumigation. Further dosage should be heavier th ally given. The proport used for 100 cubic feet of sp ounce cyanide, one fluid oun ric acid, three fluid ounces w in case the tree is infested w purple scale this dose may b when the tree is to a certai dormant.

Sulphured Fruits.

Arthur R. Briggs of San gave a history on the Pure and its effect upon the drie dustry of this State which be quoted from at length i vator. In the discussion follo Mr. B. E. Hutchinson of Fr on the heartaches caused by losses made by an unwise this, the sulphur question, a it was opened last fall. had given more alarm than possible for the tariff quest to the fruit industry. Mr has been in the fruit curi for many years, and has methods of curing to avoid phur, if possible, but nothin found. Later the chem shown conclusively that th product contains no po stance. Prof. Wickson ad position taken by Mr. Hutch Mr Briggs, and said that process is the survival of from over one-third of experiment in fruit preserv

Soils and Fruits.

Prof. W. W. Mackie of th ment of Agriculture, in an relations between soils a said that handling of the soil to be one of the most tures connected with the agricul calling. It is also the least u and no method ever devised mad analysis of soils infallible. The

e ride on Friday afternoon was
of the pleasantest features of
week, also most instructive, for
of the lessons of the week were
rced. The most emphatic was that of cover crops. Where a cloddy, intractable condition prevailed in one orchard, near it smooth surface of perfect tilth showed that something had been done to mellow the soil. We were told it had heavy cover crops for the past two years.

* * *

The vast acreage of thrifty oranges about Riverside were also of interest to those from other than citrus districts. It was a great revelation of the greatness of this industry of the Southland.

DRY FARMING.

Fred L. Boruff, manager of the Porter Ranch at San Fernando, exhibited at this office just before the recent rain, samples of grain grown on the ranch this dry season which is sufficient to give a great lesson to grain growers. One bunch of this grain measured over five feet in height, and was grown on land which was not in any sense moist land. We were told that other grains growing in a field immediately adjoining the one in which this grain grew ran only from one-fourth to one-half the height of that which was shown to us.

We were quick to congratulate Mr. Boruff on the fact that a season like this he was fortunate to be able to command irrigation water to grow such remarkable grain. He was equally prompt to inform us that not one drop of irrigation had been given the land on which it was grown. It was simply a case of thorough soil preparation before planting the seed.

Before planting last fall the land was disk-plowed to a depth of 10 inches and followed immediately with harrow and level. Following this the disk cultivator put the surface in perfect condition. Then the land was seeded with 120 pounds of barley, drilled in to a depth of 2½ inches and the drills 6 inches apart.

It cost to put the land in condition for the seed the sum of $2.25 per acre. It should have been mentioned that to the drill was a plank attached by chain to drag after and give the ground a smoothing. This grain should be an education to every farmer who contemplates growing grain another year. Let the ground be well prepared and the returns will justify the additional expense, especially if the year be a dry one; and if it is one of abundant rainfall will surely do no harm.

P. & O. CULTIVATORS.

The Parlin & Orendorff Co., of Canton, Ill., manufacture four leading lines, consisting of Plows, Harrows, Planters and Cultivators, and several subsidiary lines, such as Stalk Cutters, Potato Diggers, Beet Implements, Garden Implements, Barrel, Box and Basket Carts, etc.

The following is a partial list of their Cultivators: Walking, Riding, Combined Riding and Walking, Double Row; about twenty-five different styles, each one of which can be equipped with all styles of gangs and attachments. In addition to these there are many special styles, such as Disc, Listing, Beet, Orchard, One Horse and Garden; some of which are made either single or double row, and can be equipped with all kinds of attachments and appliances to meet the requirements of every condition of soils and crops in all sections of the country.

These lines are carried in stock not only at the factory at Canton, Illinois, but also at nearly forty branch and distributing houses in all parts of the country. The P. & O. Co. has a branch or distributing house in every important implement center in the United States, Canada and Mexico.

Deciduous Fruit Cult

FRUIT EATING.

THERE is nothing more desirable from a fruit growers' standpoint than to have the public eat as much fruit as its capacity will warrant. Many individuals imagine that fruit does not agree with them under any circumstances and, no doubt, some people are constituted that way. We doubt, however, if even a small majority of the doubtful class really are so afflicted. There are certain individuals who are sent to the vineyards by their physicians to eat grapes with the bloom on fresh from the vines to cure certain ailments. There are others who acquire distress by doing this very thing. This is proof again that we all cannot eat fruit alike, and to get the most out of life, we should learn how to eat plenty of fruit. We are not educated along the winding path of the physician, but we have learned a thing or two and not the least of all that there are many ways of doing the same thing. We have found that best results often follow the eating of one kind of fruit at a time and eating skins and all of some kinds of fruit is not what it is cracked up to be. We have seen (and have even done the same thing ourselves) persons pick grapes from vines by the roadside, rub off as much dirt as possible and eat the balance with the grapes and then have a feeling that they have eaten too much when in reality they had not, had the dirt with the seeds of various ferment and other things been mixed with the fruit been previously rubbed off.

Right along this line we have before us a statement relating to results of some experiments. A young man was given some sterilized food and an examination some time afterward showed an entire absence of fermentation in the stomach fluid. He was given some unwashed grapes to eat, skins and all and a short time afterward found that the contents of the stomach were in an unnatural state of fermentation containing millions of microbes that hasten such a condition. It is known that the skins of fruit harbor great quantities of things that create unnatural conditions in the stomach and frequently cause a decomposition of the food before it has time to digest.

Now, for the sake of the consumer who has a tender stomach, and for the cause of the grower, we beg the eating public to learn the way to eat the greatest amount of fruit without bringing remorse. If fruit eaten from the tree distresses you, try washing it clean and then skinning it before eating.

APPLE "REVELATIONS."

As a take-off on some of the fool theories advanced by various "plant wizards," the following from an Eastern exchange will pass. It is in reply to a former communication suggesting that the way to grow seedless apples is to grow the tree from a cutting "upside down."

"I may say that I tested this method thoroughly myself some years ago, while living in Arkansas, and I never failed in an experiment made. In every case where one succeeds in the original propagation and secures a tree growing upside down, it always bears seedless fruit without fail.

"Another method which I followed was almost as surprising in its re-
sults, though not of so m
cal value. I mention it, h
account of its scientific in
expert propagators are

The Vegetable Garden

THIS MONTH.

The vegetables are in need of plenty attention. Don't let the heat of the sun find any dryness or great injury will be done or crops lost. Keep the moisture there and allow no stoppage of growth, if best results are desired.

Peas, sweet corn, squash, pumpkins, cucumbers, melons, okra, beets, carrots, lettuce, radish, turnips, parsley and spinach seed may yet be planted. Plant onion sets, cabbage, sweet potatoes and tomato plants, asparagus, horseradish and rhubarb roots.

It is a little late, but Roselle or jelly plant may yet be planted. Get good seed and do not plant too thick. The plant grows quite large if not crowded. Rows may be either three or four feet apart and plants at least a foot apart in row.

CARBON BISULPHIDE.

These warm days require moisture the farmer and gardener in their warfare aginst noxious animal and vegetable life. It is very valuable and its vapors are heavier than the air. These vapors or gases are deadly, and, therefore, very destructive to all forms of animals, the stronger fumes affecting even man. It is used against rodents, insects affecting the underground part of plants, such as wooly aphis, ants and for destroying insects in stored grain, fruits and vegetabels.

In the case of root insects a small quantity may be poured into a hole made in the soil near the plant. This opening should then be closed with a ball of moist earth. A wet sack spread on the spot helps. The fumes are deadly to borers, affecting the collar or base of the stem of young peach trees, and the writer has used it repeatedly for the peach borer with the greatest satisfaction. With a spade or hoe a shallow, funnel-shaped cavity is made in the soil about the base of the stem. A teaspoonful of the liquid is then poured upon the soil in the cavity in two or three spots, or a circle six inches from the stem. The loose soil is then quickly heaped up around the stem and patted down with the back of the spade.

TOMATO CULTURE.

In a communication on tomato culture in Coachella valley, H. C. Lalmaugh says in the Valley News:

Do not try to grow too many plants on a small piece of land. The rows should be four and one-half to five feet apart, and the plants three to three and one-half feet apart in the rows. When they have started to grow nicely apply one tablespoon each of nitrate of soda and potash to each plant. Give them this application three or four times until the tomatoes begin to ripen. The soda will produce large thrifty vines which are necessary to protect the tomatoes from the sun and the potash will make smooth tomatoes.

Irrigating is a very important thing. Give them plenty of water until they are in full bloom; then give them two or three slight irrigations so they may become quite dry which will cause the tomatoes to set on the vines a good deal better. The first setting is where the profit is obtained and when they are once set give them plenty of water.

The Ornamental Garden

THIS MONTH.

These warm days requires moisture and occasional cultivation only to make a wonderful growth. Likewise a little shortage of water will cause loss of growth or even the death of the plant very quickly. Don't let a plant indicate need of moisture at any time. Always growing, always healthy.

Especially keep the lawn well wet. Blue grass will have a far better chance of keeping the joint grass and weeds out if given strong growth of its own at all times.

For fall flowering plant nasturtiums, phlox, centaurea, dianthus and mignonette. Palms may be planted now. Chrysanthemums, golden glow, golden rod, Shasta daisies and other like plants which have not been divided and planted should be attended to at once. If the day of planting is warm, protect by shading with newspaper or other shade. It is late for carnations, but if given good care they are yet all right.

Gladiolus should all be in the ground now. The writer planted his last bulbs a week ago and the rapidity with which the shoots came through the ground was astonishing. Other bulbs planted in the fall are now just coming into bloom and by this range of planting we hope to have a summer of those beautiful flowers. Remember that gladiolus appreciate plenty of moisture.

Hollyhock, amaryllis, agapanthus cannas will all do well if planted now. Don't let the bloom remain on Watsonnias as the bulbs will be stronger if the bloom is cut.

Cut the flowers on Shasta daisies as fast as they open fully. The closer you pick the more they bloom.

THE CANNA.

Deep planting will often be sufficient as the stalk has the support of the soil around it. Good, rich sandy loam and plenty of water are required. As soon as the spikes get to blooming well they may be cut and put in water when they will continue to grow and bloom as well as in the ground.

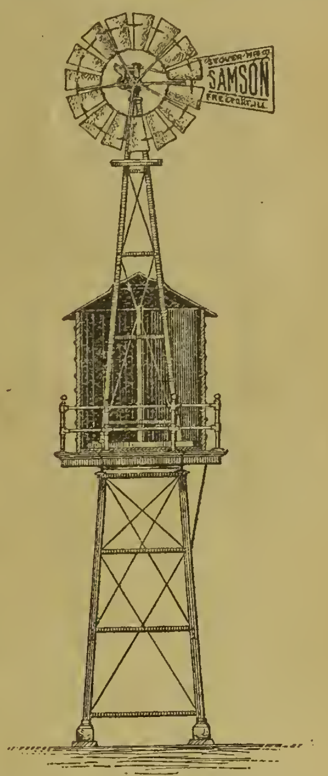
The canna in the large sorts is very pretty and showy. For tropical effect we have few plants that equal it. The foliage is in different colors, so one can have quite a variety.

Cannas should be planted somewhere in the background, for they grow so rank they hide other things. Their blooms are rather coarse, too, so they do not combine well with other flowers, or do well for cut flowers unless used in large bouquets and with large ferns or leaves. Nature shows this by giving the plant large leaves.

Do not let them go to seed if you want a long season of bloom. The old bare stems left after the bloom falls look ragged and bad, and should be cut out at the ends. Do not cut out the whole stalk, for it will send out a blooming branch from each joint until the whole stalk is exhausted. Then it, too, should be cut out.

"The more I see of town," says Farmer Wise, "the more I am satisfied with the country."

SAMSON WIND MILLS
Have double gears, removable bearings and center lift, which double the life of the mill. They will last longer, pump more water and give better satisfaction than any other WIND MILL.



This is an up-to-date Sub-structure, Tank and Wind Mill outfit complete; substantial, economical and attractive. We build all kinds. Write us or our general agents for full information and prices, description &c., before purchasing.

QUERIES AND REPLIES.—Mildewed Pears; Grape Jelly; Who Owns the Apples; Passion Fruit; Aphis, 538.

VETERINARY.—Lump on Teat; Lump on Jaw; Hard Milker; Scaly Skin; Worms; Barrenness in Cows; Bloody Milk, 539.

HOUSEHOLD.—The Cry of the Pines; Two Little Shoes; Recipes, 540, 541.

PRODUCE MARKETS.—Los Angeles Market; San Francisco Market; Citrus Markets, 542, 543.

A SUCCESSFUL MEETING.

One of the most successful conventions held under the direction of the State Commissioner or of the State Board of Horticulture was that just closed at Riverside. The attendance from other sections of the State was fully up to the average, and it is possible the attendance of the local people of Riverside was equal to that usually given by the local communities. The work of the local committee was complete in its attention to all details which go to make the convention a success and the comfort and convenience of the out-of-town delegates. This local committee was under the direction of James Mills as chairman, the members being H. B. Chase, J. H. Reed, C. E. Rumsey, and E. W. Holmes.

One little feature which, while it did not add especially to the comfort or convenience of the delgates, was the graceful act of supplying each delegate with a handsome silk badge. The meeting place was one of the most comfortable ever granted to a convention of this kind, and the hotel accommodations were perfect.

WHERE WERE THE LOCAL GROWERS?

One point which may be made regading the convention is brought out by the remark often made by members of the committee and those interested in the good name of Riverside that "we apologize to you for our local people not being represented more liberally in these meetings. We have taken our automobiles and gone to the orchards and urged them to come and in every way endeavored to secure a representative attendance of our local people, but they prefer to remain in their orchards instead of coming here learning of these the brightest minds in the fruit culturing fraternity of this State."

While this caused some concern and a little embarrassment on the part of the members of the local committee, it should not have done so. At least to no greater extent than it should the local committee wherever a State Convention may convene. We think Riverside attendance was fully up to the average, because it has always been a matter for apology on the part of local committees that their own people will not attend. In our experience in the past, we think perhaps Hanford was the most thoroughly roused in regard to the importance of the convention and gave liberal attendance on the part of its local men. But even there it might have been far better.

DON'T APPRECIATE ITS IMPORTANCE.

The excuses that may be offered by the farmer for not attending the conventions and institutes are doubtless many. But we presume the more usual one is lack of time. Truthfully, we think the more usual reason is the lack of appreciation of the great good which these conventions may have for the producer. Ordinarily the cultural newspapers give liberally of the discussion and papers of the convention which the farmer may take and read, and with practically no loss of time get the gist of the convention. But as good as this may be, it has no comparison to the face-to-face talk and the greater interest which is created in growers when they come in contact with the bigger men of the industry who have done things in a large way. In fact, we think that one of the most helpful features of any convention is the acquaintance formed between producers of different sections and the enthusiasm for better work which is there established. Most of our farmers have knowledge which they do not fully live up to, and it needs the impetus of such a convention to inspire better work. Besides this, there is, of course, a vast fund of knowledge brought out by the discussions of the papers which have been produced by some of the brightest of scientific men as well as by other farmers.

VIEWED THE ORCHARDS.

In addition to above points, the inspiration of seeing some of the best cared-for orchards in the State and discussing methods of culture, and more of planting, disinfection for insects and fungous diseases, and other points are of great value. The local committee provided the delegates with automobiles and showed them over the representative orange growing sections of Riverside. There were shown us orange trees four years old larger and thriftier looking than were six-year-old trees immediately across the street; soil, water, and other features provided by nature identical. The only difference between the two orchards was in the mental capacity of the owner or caretaker. The one was making a success of orange growing, the other practically a failure. The question naturally uppermost in the mind of the visiting orchardist is "why?" The answer was not hard to see.

THREE BOXES ON TWO-YEAR-OLDS.

One orchard pointed out to our party on this ride was a 2-year-old Eureka lemon grove, many trees in which will give three boxes of lemons per tree. This is not abnormal, but simply an indication of thorough care and good soil with plenty of water and the best of nursery trees. This orchard is the property of the Arlington Heights Fruit Company, and James Mills is the manager. Mills conducts orchards as he lives—on the high pressure basis. Why not all orchardists in the State grow fruit on this same plan?

WHICH IS MOST IMPORTANT?

That the Fish Commission of this State receives from the State Treasury nearly twice as much as does the Horticultural Commission certainly looks as if the sportsman is vastly favored to the detriment of the greatest of productive industries. Commissioner Jeffery said at the State Convention that the Fish Commissi ceives the sum of $87,500 this term, whi regular appropriation to the Horticultural mission is $35,000 plus $12,000 for the inse The State Mining Bureau also receives than horticulture. Its appropriation is $

Is not the fruit growing industry of mor portance to this State than is indicated by figures?

PREVENTING FIRES.

Fortunately, the recent showers will blessing to the vast forest ranges of Calif in deferring a little longer the danger fron est fires which is always before us fires are a great menace to the State, and sections of the central part of the State are ing with the government in employing addit fire wardens who will serve from May 15 October 1st. This additional protection is a wise move, but a protection still greater more effective will be that of the entire pe That is, let there be a live interest in the ter of fire prevention and let every one best to educate those who are going i mountains to guard against starting fir may cause untold damage. Many of the m astrous fires in California have been the of thoughtless leaving of a pleasure ca A few heavy fines have helped to remind thoughtless ones. If every camper, every to the mountains will constitute himself a service man to detect such careless ac will soon have far less of these needless

Every one who has a foot of land in this every well wisher of the State, is vitally ested. Let us show our interest.

WORM COSTS $11,000,000.

It has been estimated by leading ent gists that the United States annually $11,000,000 on account of the codling moth. average farmer's tree yields fruit on which 50 per cent is ruined by worms. Worse, i become so common that the ordinary f takes it for granted that it must necessar He is not awake to the fact that a remed in his own hands if he will but use it. S is now perfected so that the ordinary f may accomplish good results in his orchar yet he remains passive expecting the natu emy to come in time, and thus save him the tion of destroying the pest. Or, more pro the farmer thoughtlessly puts on the marke fruit as the worms spare and takes it for g that "Fate is agin him" in not giving him good fruit.

Central California

Eggs at Spokane are now quoted at $6.00 per case.

The setting of fruit about Fresno promises great output.

Tulare grangers held a picnic at Dinuba on last Saturday.

Serious grass fires are already occurring near Bakersfield.

Much new machinery has just been added to the Turlock creamery.

Tulare Fair Association is planting 1000 eucalyptus on its grounds.

Much thinning of fruit will have to be given to Tulare county fruit.

The Tulare irrigation flume across St. Johns river went out last week.

Pumps are going into wells near Tulare for irrigation for the coming season.

It is estimated there are between 50,000 and 60,000 head of sneep in Tulare county.

The California Canneries Company has issued a circular urging careful thinning of fruit.

State forester Lull has appointed two fire wardens for Kern county and one additional for Tulare.

W. A. Beard of Sacramento addressed the citizens of Colusa on the Iron canyon irrigation project.

Some orchardists near Santa Clara report that the prune crop will be lighter than at first anticipated.

The Kings County Promotion Association is issuing a boolket regarding farming industries of that section.

One turkey producer in Stanislaus county expects to have 1500 fine, fat turkeys for the Thanksgiving trade.

The growth of the dairy industry about Tulare cals for a third creamery which will soon be erected in that city.

Grain and hay prospects in the neighborhood of Santa Rita and Castroville are much better than anticipated.

Apples and pears are looking exceptionally well in the Santa Clara Valley. The fruit is, however, showing a large per cent. of drops.

A canvass by fruit growers of judgment, in the orchards about Hanford, has developed the fact that almost no injury was done by the frost to the fruits.

Gov. Gillett has wired Secretary of State urging the retaining of David Lubin as a delegate of the United States to the International Institute in Italy.

Thorough winter irrigation and early spring cultivation is urged on the part of many orchardists as the only plan of securing best results from the orchards.

Central California Produce Company, a co-operative association at Turlock, is in successful operation and has a warehouse full of goods for its members.

A combination fruit wagon and truck has been invented by one San Jose fruit grower which is claimed to be one of the handiest and best wagons in the market.

The suit of the Evans Ditch Company against the Lakeside Ditch Company over the rights to take water from the Kaweah River has been decided in favor of the Evans chard this year.

Southern California

Highland has practically finished its shipping of navels.

The rain of last Saturday did much good to ranchers in Antelope valley.

San Bernardino will hold a street fair in that city beginning May 19th.

The Yuma valley expects the early establishing of a large asparagus cannery.

One contractor has agreed to sink ten wells at Palmdale in the Antelope valley.

Mr. Iams of Silsby writes: "Some cantaloupes setting but a large acreage will be very late and light crop."

A new cantaloupe packing house has been erected at Shepherd on the Holton Interurban Railroad, Imperial valley.

Orange county grain growers have found from this year's experience, at least, that the early sown grain is the winner.

At a floral parade at the festival to be held at Arrowhead, 25 forest rangers will appear in mountaineer's costume.

The Fullerton Vegetable Union has shipped its last car of sweet potatoes for this season. The output for the year was about 12,000 sacks.

Twenty thousand acres of eucalyptus will be planted by the Arlington Eucalyptus Timber Association on land purchased from the San Jacinto Land Company.

A forest experimental station of 2000 acres has been laid out in Verdugo Canyon near San Juan Capistrano. It will be in charge of the Department of Agriculture.

The acreage devoted to grape culture in the Coachella valley has greatly increased during the past year. It is estimated the 400 acres will begin bearing this season.

The recent rains have added materially to the irrigation supply in all the ditches. Santa Ana Valley Irrigation Company reports six extra heads flowing in the ditches.

Irrigators in District No 8, Imperial valley have complained bitterly that the California Development Company has failed to deliver sufficient water for the needs of the farmers.

Less complaint from decay of oranges has been made this year than since the shipment of oranges began in California. This is due to two reasons: The greater care of the orchardists and packers and the far better time made by the transportation companies.

The wage scale adopted by the cantaloupe growers of Imperial valley, is as follows: For white laborers, $2.25 for 10 hours' work with a 25 cents bonus a day for those who remain for the season; Japs $1.75 for 10 hours' work with a bonus of 25 cents per day for those who remain for the season.

The various melon associations of Imperial valley have formed a central exchange or organization for the handling of business for the following associations: Imperial Fruit and Produce Co., Imperial Cantaloupe Association, Keystone Cantaloupe Association, El Centro Fancy Melon Association, Interurban Association, El Centro Cantaloupe Association.

The Coast

Extensive orchard plantings have been made at Kiona, Washington.

Strawberries have been selling at Spokane at 50 cents pint during the past week.

Fruit inspectors at Pendleton, Ore., are waging a fierce war against San Jose scale.

President Hill of the Great Northern Railroad will preside over the apple show at Spokane next December.

The acreage of wheat at Alberta, Canada, will show an increase of about 20 per cent over that of last year.

The most thorough campaign for spraying for San Jose scale ever engaged in at Walla Walla, Washington, has just been finished.

The Farmers' Institute train is traveling over Eastern Washington this week and will hold meetings at Starbuck, Turner, Dayton and Walla Walla.

Four thousand acres of additional land are to be put "under the ditch" by extensive irrigation improvements being made in the rich Columbia valley in Washington.

Fruit inspectors at Wenatchee, Washington, have found that the winter spraying with sulphur and lime water did not destroy the twig borers and a second spraying is now offered.

Wenatchee, Washington, fruit growers are contracting with the power company for electricity for irrigation purposes. Six hundred horse power is desired.

Canada has served notice on the government of India that it is able to receive no more emigrants from that section owing to the present condition of the labor market.

The sugar acreage of Australia is decreasing at the present time at the rate of about 4000 acres per year. It is said to be caused by greater profitableness of dairying.

The Snake River district, near Colfax, Wash., reports that orchards have not been injured in the least by the frosts. The frost was so severe that cantaloupes under glass were frozen.

Hawaii now produces about $30,000,000 worth of sugar anually, and is not in favor of any tariff revision which looks toward lower duty on sugar, as she fears competition with Philippines.

Oregon hop growers are hopeful for the future of the industry, and but a few are reducing their acreage excepting in the neighborhood of Salem at which place about 2000 acres have been turned under.

More than $25,000 is offered in cash premiums for the first annual Colorado Interstate Fair and Exposition to be held in Denver the second week in September of this year. Over $150,000 will be expended on buildings and every structure will be thoroughly up-to-date and provided with every modern convenience.

The Union Pacific has established a rule which will permit wool in transit to stop at Omaha. It may be shipped at the convenience of the buyer and grower and stored at a central point until reshipment is desired. This has been secured through hard work of many of the wool growers of the Northwest Pacific Coast.

Profit in the Poultry

We solicit short articles of a practical nature from the fanc
breeder, giving their experiences with poultry. All inquiries pertа
management, disease and its prevention will be answered through

TURKEY TALK.

Among the American fowls the turkey is entitled to the first place, and is truly an American bird. He seems to be utterly unadapted to confinement, although there are instances where turkeys have been grown successfully in confinement. Yet to be profitable turkeys should be allowed freedom, for it is as natural for them to roam over fields and hunt a good part of their food as it is for a duck to take to water.

The bulk of the turkeys that are raised on the Pacific coast are grown in the grain-growing districts. For here is where the turkey seems most at home.

Give a flock of turkeys a grain field to forage on and they seem at home and contented. Where we consider giving turkeys free range, we must consider the enemies with which they have to contend.

While they will not stand confinement, it is best to confine them during the laying season, for unless we do they are left to steal their nests away and thus we loose many eggs and often poults, while if we keep them yarded until they lay at least then we can turn them out on range. The hens are very sly and care should be taken not to disturb them when they are laying or they will not go back to their nest, but will hunt a new one. If they get accustomed to their nest we can remove the eggs, replacing them with China or hens' eggs.

It is well to leave four or five china or hens' eggs in the nest. If the nest the hen selects is not protected, it should be fixed so as to afford some shelter for the hen while laying. If we yard our turkeys a part of the day a yard 50x100 feet will do for a flock of 20 hens; the fence, if it be wire, need not be over five feet high. We have known a flock of 10 or 12 hens and a tom to be yarded in a lot this size during the breeding season, with no bad results. But the growing stock need all the range they can get, and the mortality is not nearly so great if they have range, as when confined.

Varieties of Turkeys.

The domestic turkey is a descendant from the wild turkey, which is still found in many places on this continent. The wild turkeys have often been captured and have been very successfully crossed with the domestic turkey, restoring vigor without and permanent injury or loss as to size. The wild turkey resembles the bronze more closely than any other variety. The bronze and White Holland are the varieties most extensively bred on the coast. Of the two varieties the bronze being the larger and most popular.

The Narragansett turkey is quite a favorite in some sections of Rhode Island. The buff, black and slate are quite rare on the coast and a good colored specimen of the buff or slate is scarcely ever seen.

Hatching.

In hatching and rearing turkeys, the natural methods are used almost exclusively. We can use either turkey or chicken hens
and mothers. Many
hens for the first cl

e makes money.

they have become accustomed to the grain food, which, since they were three weeks old, has been kept by them in troughs in the coops so constructed that the little turkeys can get in and the older fowls kept out. By the time the poults are nine or ten weeks old, I have reduced the soft or cooked feed to once or twice a day. By September the older poults are dependent upon grain food and range.

For fattening I had good results with a mixture of grains proportioned as follows: Two bushels whole corn; two bushels cracked corn; one bushel oats; one bushel Kaffir corn."

Mrs. Mackey's Ration:

"The first feed I give is milk curd, with onion tops and tongue or peppergrass, cut very fine, seasoned with black pepper. I give this morning, noon and night. It is a mistake to feed very often, or too much while they are young. If poults are fed three times a day from the time they the hatched until they are grown, they are fed often enough. Yet they must have something to pick at all the time, hence I would advise that they be kept in a grass yard where grass is kept low.

"As they grow older I add other things to the food. Table scraps are splendid for them. If I have infertile incubator eggs I boil them and mix with the other food, but never use fresh eggs, simply because I do not consider it necessary. I give milk instead of drinking water, when it is plentiful. I keep grit constantly before them. Wheat is one of the finest feds for young turkeys. Cracked corn is splendid when they are older. My rule has been to mix grains of wheat in the food from the first, so that when they are old enough to change from curd to grain it will not be so hard to change foods."

AROUND THE YARDS.

A turkey will cover from 15 to 20 eggs.

* * *

Turkey eggs are usualy fertile and generally hatch well.

* * *

Turkey hens are profitable until about five years old.

* * *

Keep grit and charcoal before the poults at all times.

* * *

Turkey hens protect their young better than chicken hens.

* * *

In mating turkeys one male to ten or twelve females is about right.

* * *

Lice is the little turkey's worst enemy, so keep them free from this pest.

* * *

The success in feeding young turkeys seems to be in feeding often, but not overfeeding.

Eggs stand next to milk in available food material for the sick, as they are easily digested and absorbed if raw or properly prepared, says the Southern Poultry Courier. Physiological chemists tell us that 97 per cent of the albumen and 94 per cent of the fat are absorbed into the blood stream. These chemists tell us that eggs are a complete food for all young mammals, as they contain in correct proportion the tissue-building material, in form of albumen (white) and mineral matter, in the form of phosphorous, lime, potassium, iron and sulphur; the heat and energy material in the form of oil (fat) in the yolk, and a large amount of water.

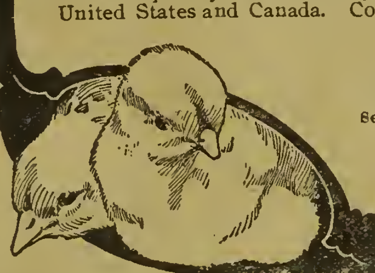
Take Care of the Chicks

It is said there is a mortality of 50% among young chicks every spring. This means a tremendous loss. Think how great the poultry industry would be if even a fraction of these lost chicks were saved to become egg producers or fat market fowls. *Care* and *proper feeding* at the time of hatching and during the first days of the chick's life are absolutely essential to its well-being.

Begin as soon as the chick takes food regularly and give a little of Dr. Hess Poultry Pan-a-ce-a once a day in soft food. If you do this and chicks are kept dry and warm, your losses will be very slight.

DR. HESS
Poultry PAN-A-CE-A

was formulated by Dr. Hess (M. D., D. V. S.) for the express purpose of meeting and overcoming the hundred and one ills that perplex the poultryman. While it is beneficial in many ways and also destroys germs, its greatest worth is as an assistant to the digestive organs Its use makes the largest possible per cent of food available for healthy growth. Hence chicks mature early, hens lay many eggs, and market birds fat quickly. Endorsed by the most prominent poultry men in the United States and Canada. Costs but a penny a day for 30 hens.



Sold on a written Guarantee.
1½ lbs. 35c. 5 lbs. 85c.

CONGO
"NEVER-LEAK"
ROOFING

Congo on Baxter & Co.'s Saw Mill, Fargo, Ga.

Send for Free Sample—To-day!

Does your roof leak? Then get Congo.

Congo is the best ready roofing ever offered to the man who is looking for something **good, reliable and not too expensive.**

It is called "never-leak" Roofing. This sounds like a big claim to make, **but we know Congo.**

Try it. Cover that old roof, which you have repaired for years, with Congo, and you'll find it the most durable, **proof-against-everything** kind of roofing made.

Economical? Yes, for your bills for repairs on other kinds of roofs in a few years would pay for Congo. It's not affected by heat, cold, rain or snow. It is soft and pliable,—like rubber—but infinitely superior because it will not crack, buckle or shrink. Congo will give maximum service at minimum cost. **Cheaper than shingles and will outlast them.**

Isn't Congo worth investigating?

Write for a Free Sample. **Test it.** Soak it in water as long as you like. Water can't hurt Congo. To heat, cold and acid fumes it is also impervious.

Congo is the roof you want. Let us hear from you.

CAUSE AND TREATMENT OF CANKER.

Canker frequently follows a severe cold or attack of roup. It may also be caused by roosting in damp quarters, scratching in moldy litter or being fed or having access to damaged or moldy grain. The symptoms are very plain: usually yellow, cheese-like growths in the corners of the mouth, roof of the mouth or on the tongue, though occasionally this matter appears in the wattles, face or around the eyes. The first thing to do is to remove the cause. The birds affected should be isolated and the poultry house and equipment cleaned and disinfected. A simple preventive which is usually effective is a slight film of kerosene on the top of the drinking water. Oftimes this will prevent the disease appearing further in the flock if other conditions are attended to. The fowls that are isolated should have the canker removed with a wooden stick and the spot treated with undiluted creolin. All matter removed should be very carefully burned so it will not cause trouble. Each fowl may be given a tablet of mercury protiodide one one-thousandth of a grain, drug strength, morning and evening, though clean, dry, well-ventilated quarters and good food will frequently enable the bird to recover if the canker spots are removed as advised.—Western Farmer.

THE EFFICACY OF DUST BATHS.

The natural way by which fowls cleanse their bodies and keep them free from lice and mites is by means of dust baths. In providing these baths, it is well to bear in mind the specific points which prompt their use. While exercise is an important thing provided by the baths, the main good they do is to relieve the birds from lice and mites, which would otherwise make their lives miserable. The birds roll and scratch and fluff their feathers until the fine dust is thoroughly worked through their plumage and down to the skin. The insects referred to breathe through pores in their bodies and the fine particles of dust close these up and the vermin die.

It will be seen, therefore, that the dust bath must be composed of very fine dust to be effective. The dryer and finer it is the better the fowls will like it and the more good it will do them. Some people mix fine screened coal or wood ashes with road dust and think that the combination is better than either one alone. A little tobacco dust mixed with the wallowing material is also a good thing as it aids in exterminating vermin.

HENS NEED VARIETY.

Hens require a variety of food. No one kind of food will do. If you have oats or corn feed a little to them occasionally. Then give them all the alfalfa or clover or other green stuff that you can get. It is important also that you should have grit before them all the time. Prof. Dryden, who is an authority on poultry matters, recommends that grain should be scattered in a litter of straw so that the chickens will have to scratch for it. The skillful feeder watches his hens and feeds them each day just what they want and no more.—Deseret Farmer.

Medium sized turkeys are better than extra large ones where the chief object is the production of turkeys for market.

eat makes good the assimila-
the food by caring off the
apidly and the muscles harden,
being deposited in them, in-
f on them. In people as well
als having the fat in the mus-
ot weakening like carrying as
weight on the outside of a
muscle. When horses are little used, they go out of condition quickly, the skin does not receive its bathing of sweat from the inside out. The police talk of sweating a suspected criminal when they make him tell all his secrets; mentally, it brings out all latent "cussedness," so is it that sweating brings out of the horse all his impurities. The same is as good a cure for many of the troubles of sedentary people as it is for horses.

Stable.

When the horse comes in from the road, after stripping off the harnness, stand him in a sunny, sheltered place until his back dries; if it is at all cold or windy then throw over him a blanket. Begin by wiping his legs dry, rubbing them with a piece of sacking; should they be crusted with mud moisten it with a wet sponge and wipe dry. Unless the roads have been very heavy the wiping dry will take the surface mud, enough to make it easy to dry them thoroughly. The most of the time the roads in California are only dusty, and the wiping removes that until the time for the brushing. By this time the sweat should be attended to on the back and sides, scrape it off if very profuse, then wipe the hair dry around the parts where the harness has rested, by the time these are wiped the horse is cool enough to have a nip of water and to be put in for a little hay. After an hour's time feed and water him fully and then groom him carefully using the curry comb to remove sweat and finishing with the brush. A blanket in winter and a light sheet in the summer will help to keep him clean in the stable. Brush the mane and tail out carefully and take the tail in the hand and examine for loose straws. The feet should have the manure removed; particular people often have the horses' hoofs blackened for carriage use. Care in grooming will save doctor bills, for horses are rarely out of condition that receive regular grooming and feeding. When the man wishes to give a horse condition powders, he had best buy a new set of cury combs and see that the horse reecives a full thirty minutes grooming every morning.

Clipping.

The only way to save time on grooming is to clip the horses. This is often a benefit when the horse's hair tends to grow long. A clipped horse is wiped off and then brushed. The coarse sacks that imported salt comes in are excellent for this purpose. They can be purchased at the large groceries for ten cents each. The work horses on a ranch are best clipped for they come in covered with dirt and both man and horse is tired. It is almost impossible to get them well groomed either morning or evening. They come in covered with dust and drenched with sweat; the long hair remains wet all night. Putting a blanket on a horse in this condition is like putting a cold compress on him rather weakening. He has a blanket stripped off, is harnessed while still wet and goes off down the field shivering in the early morning chilliness. At night the same thing is repeated and at ten years the horse is old and worn out. Now, clipping saves that trouble completely; it adds greatly to the life of the horse by lessening the risks

THE BEST
CREAM SEPARATOR

AND THE DIFFERENCE IN
CREAM SEPARATOR ADVERTISING

All separator advertisements seem very much alike to the average reader, who is at a loss what to make of them and how best to attempt guessing which may be the best machine, where all claim to be the best and all appear to be about everything that could be asked for.

THE EXPLANATION AND THE SOLUTION ARE TO BE FOUND IN THE DIFFERENCE BETWEEN DE LAVAL AND OTHER CREAM SEPARATOR ADVERTISING.

The De Laval Company has always stuck to the old fashioned plan of having its advertising written in its own offices, by the men who make and sell its machines and have been doing so for years, and who know no more about advertising than to describe as simply and best they can the merit and efficiency of the machines they offer to the public.

Practically every other separator concern of any consequence has its advertising composed and in great part "invented" by professional agencies and hired advertising writers, located in the big cities, who could not themselves tell the difference in looks between a cream separator and a corn sheller, and who take up the advertising of everything that comes to them, from needles to automobiles for anybody able to pay for their services, just as does the lawyer for any client who comes along, whether the case is good or bad and the client right or wrong.

It is up to these professional composers of prose, poetry, fiction and romance in an advertising way, and the professional artists who work with them in illustrating their productions and putting them into showy and attractive shape, with their wide knowledge of what "takes" with the public generally, to claim the utmost their prolific brains can evolve for the separators they are retained to advertise.

What these professionalists all do know, or are at any rate first told, of cream separators is that the DE LAVAL machines and the advertising descriptive of the DE LAVAL machines are the ESTABLISHED STANDARDS by which their advertising productions must be measured, and MUST ENLARGE upon in some way, or else they will stand little show of drawing any business for their patrons.

As a result, the biggest advertising claims are frequently made for the poorest and trashiest separators. The biggest advertising done and the biggest claims made are by jobbing and "mail order" concerns who don't even make their own separators at all, but simply buy them where they can buy them cheapest, and who are almost invariably selling a machine which has already proved a business failure once or twice before under a different name and a different coat of paint.

When the DE LAVAL claim was justly made of saving $10.- per cow every year for its users one of the poorest and cheapest separators ever produced put out a claim of saving $15.- in the same way, and since then another has come along and made it $20.- The next may as likely make it $25.-

BUT IT IS THE MACHINE AND NOT THE ADVERTISING THAT SKIMS MILK POORLY OR PERFECTLY AND LASTS TWO YEARS OR TWENTY YEARS AFTER THE BUYER HAS PUT HIS MONEY INTO IT, AND THAT IS THE DIFFERENCE BETWEEN THE DE LAVAL AND OTHER CREAM SEPARATORS, SMALL AS THE DIFFERENCE MAY SEEM IN THE ADVERTISING CLAIMS MADE.

The 1908 DE LAVAL catalogue—to be had for the asking—is an educational text book of separator facts, of interest to all who read and think for themselves.

of colds. In California we talk of our horse as old at seven! Back East he would hardly be more than a colt at that age. The old saying that "the life of a fence is three years, of a dog twice a fence, of a horse three times a dog, of a man four times a horse." The horse rarely lives out his full time in California.

The card and brush and sack are used to clean the clipped horse, a curry comb tears and irritates his skin unmercifully. A blanket made of sacks is quickly made for each horse and he is ready for a night's rest after his day's work. Many farmers have the work horse merely clipped on the legs and stomach. This does not do away with the wet hair over the kidneys and spine. It is better however, than letting them have cold, wet legs at night. This half or cart-horse clip, is common on mules, for it is said by old ranchers that to clip a mule all over is almost sure to lose him before the winter is over. How true this is I do not know, but the average farmer will not have a clipped mule though he may be a strong advocate of the clipped horse. Sickness in a mule is harder to combat than in a horse. For most part, whenever a mule is sick if a bran mash and rest does not bring him out it is not thought worth while to do anything more for him, for he will die anyway. I wonder if it is not the pessimistic mind of the mule that has much to do with the mule's disposition to die if he wants to?

Colts.

If it is desirable to raise colts then early care should be taken. The feet are the most important feature of a horse after all, for "no foot no horse" comes down to us from far off antiquity. A file used skillfully on the feet will toughen the edges of the hoof and save breaking off. The irregularities of gait caused by horses not standing squarely on their feet, are many. Now a foot squarely on the ground keeps the horse from going broken from the start. I have bought colts that hopped, skipped and jumped all manner of going, that after having their feet kept regular, developed into smooth-gaited travelers. Colts are best driven without shoes as long as possible, as the weight of the shoe does not help the young hoof. This applies only to colts lightly driven and not overworked. The common fault of driving a colt wrongly shod, causes many to forge or to speedy-cut themselves. The first speeding is best done barefooted. Speedy cutting has hurt many a colt's gait for life for it produces great lameness and the colt remembers, and it may take time before he will reach out in his gait again.—M. E. Sherman.

MOISTURE FOR HORSES, COWS AND PIGS.

On account of the prolonged drouth of the earlier spring, the pastures are drying up very fast and the dairymen are at their wits' ends to get the proper feed for their stock.

Mr. Gus Hanson, who several years ago remarked: "It is a hay saver, all right," is now using molasses for his milch cows, sprinkling it over their hay. Being equal to corn pound for pound for fattening purposes, it serves to keep up the flesh of the dairy cow so that the other food consumed can be utilized in the digestive apparatus of the animal to produce milk. It is obvious the cow must be kept in

Department of Agriculture that the general condition in healthfulness of farm ani- April 1 was higher than the of the past ten years, and, exception of swine, slightly han on April 1 last year. rom disease of swine during year were slightly heavier ring the preceding year; but than the average of the past s. Estimates for other classes animals indicate smaller the past year than either the g year or the average for the years.

Soled Boots and Shoes. Boots, oes, $2.00. O. J. Weber Co., 555 ıs Angeles St., Los Angeles, Cal.

Wasn't Your Neighbor Foolish?

Didn't he make a chump of himself? Wasn't it about the most senseless thing he ever did when he bought that "cheap" cream separator from a "mail order" concern that never manufactured a separator of any kind, and switches from year to year to the separator that can be bought the cheapest? Where is your neighbor going to get repairs? Why, he doesn't even know who built his separator, and the most important thing for a man to know when he buys a "cheap" separator is where to buy repairs every week.

There stands your neighbor's separator, down and out; broken; only used a few weeks; money wasted. Perhaps he could repair it if he knew where to get repairs, but he doesn't know. The fact is, there is no place to get them; his separator was one of a job lot sold "cheap" by a manufacturer who knew it was no good, and who unloaded his stock on a catalog house for what he could get. Now he's out of business.

The Tubular Cream Separator

"Different from the Others"

Easy to oil
Easy to turn
Easy to clean
Low supply can
No dirty oil cups
No bothersome discs

Simple, durable, conbenient, handsome and profitable.

No Wonder They Are Pleased

Didn't Like Mail Order Separator

SOUTH SCHROON, N. Y.

The Tubular gives us perfect satisfaction. The longer we use it the better we like it. We bought one of the improved — — — — of — — — — —, of Chicago, last spring, but we didn't like it a little bit. It was hard to run, hard to wash and hard to keep clean, while the Tubular is easy to run, easy to wash and easy to clean.
L. W. WHITNEY.

Discarded Mail Order Separator

ROBESONIA, PENNA.

After using a mail order cream separator for six months I decided to discard that machine and purchase a No. 4 Tubular Separator. The mail order separator would separate only 275 pounds of milk per hour, and did not give a thorough separation. I can skim two buckets of milk in 4 minutes. The mail order separator required ten minutes. I am more than pleased with the purchase I made from your people.
WM. F. BUCKS

Why didn't your neighbor do as you are going to do? Why didn't he buy a **Tubular Cream Separator,** built and guaranteed by the largest cream separator factory in the world and the oldest in America. For twenty-eight years we have been building cream separators at West Chester, Pa., and TUBULAR separators are used in every dairy district of the world.

Tubular Has No Rival

ZIMMERMAN, MINN.

Tubular shows no wear after three years and has never given me any trouble and from present appearances is good for a lifetime. One of my neighbors bought a — — — — — — about a month before I bought mine, and it went to the scrap pile months ago. For skimming the Tubular has no rival in my opinion. JOHN M. COOK.

We know how to build separators that will wear, and we are always where you can reach us when you want us. That's something you can tell your neighbor about TUBULARS. Maybe he would like to get right. Maybe he would like a little help. Probably he would like to have a TUBULAR if he could get a little something for his "cheap" separator. Maybe we can help him. Won't you suggest that he write for our new catalog No. 260? It tells all about it.

Mildewed Peas.

Will sulphur prevent mildew on peas? When should I apply and how? I want to raise these in September and will irrigate. But last fall they mildewed badly, though I did not sulphur till late, when they were badly afflicted.—Chas. Maha, Arroyo Grande.

Yes. But it should be used as a prevention. To wait until the vines are covered with mildew is to wait too long. It is the fumes of the sulphur that destroy the fungus, and these fumes are set free by the heat of the sun, so it is best to apply it early when the peas are a couple of inches high. It is not necessary that the sulphur should all be on the vines as what falls on the ground will be just as effective, provided, of course, it is in close proximity to the vines. It is likely to be more effective as it is hotter on the surface of the ground and the greater the heat the more fumes set free. Later on, say when the vines are ready to blossom make another application. Run your sulphur through an ordinary flour sieve to pulverize all the lumps and put 8 or 10 pounds in a barley sack that is not too closely woven and shake it over the vines as you walk along the row.—Q. A. L.

Grape Jelly.

Will you publish the grape jell recipe again that was in your paper last summer. We tried it and it was splendid; was to make grape jell so it would not crystalize. Make out of partly green grapes; boil fifteen minutes, I believe. Recipe was lost.—Floyd Nolin. Parker, Kansas.

The recipe you request was published in issue of Aug 22, and as it is of value, we reprint:

A grape jelly which will not crystalize is made as follows: Cover partly ripe grapes with water, boil twenty minutes, strain through a bag without squeezing. Let it stand over night, strain again and boil twenty minutes. Add a pint of sugar for every pint of juice, and boil five minutes, then strain into jelly glasses.

Who Owns the Apples?

Barrenness in Cows.

Can you give me a remedy for cows that will not get with calf? I have one which has been giving milk 18 months.—W. E. F., Laton.

The use of an impregnator is the simplest and surest method. An instrument can be purchased of any instrument house in Los Angeles, or the veterinary editor of The Cultivator can be consulted personally at 714 E. Seventh street, Los Angeles.

Bloody Milk.

My Jersey heifer had her first calf two months ago. She gives four gallons of milk. About two weeks ago I noticed bloody milk in one teat and sometimes little pieces of blood. Sometimes the same teat is caked a little. Please give a remedy.—R. H., Anaheim.

If the "cake" is in the teat as you say, and not in the udder, have a pint of saturated solution of boric acid made up and after each milking inject the teat full of the solution. Have the syringe thoroughly clean and use only enough to fill the teat, leaving it there.

BIG PEANUTS.

A neat feature to advertise California peanuts, is a peanut crate with a few mammoth peanuts. They are put up by J. G. Wirsching, Anaheim, and sold by many curio dealers. The above cut gives something of an idea of the size.

The address of the author of article on first page of Cultivator of April 23, is Fullerton instead of Anaheim.

The Century magazine is up to its usual standard, it is even above it and is giving some remrkable reading matter.

Literature worthy to endure is Helen Keller's "A Chant of Darkness"—certainly this remarkable blind girl's most notable achievement. The lines were originally a passage in the first draft of Miss Keller's "Sense and Sensibility," published in The Century for February and March; but as Miss Keller developed the thought her style became dithyrambic, and made a poetical chant which stood out from the prose. This passage gradually shaped itself into a complete stanzaic structure—enriched with quotations from Job and from some of the modern poets— remarkable and exquisite chant of faith.

Classified Liners

Rates 1½ cents per word per issue. No ad accepted for less than 25 cents. Our classified columns are the clearing house for the readers of the Cultivator. Here you can insert an ad for the small sum of 1½ cents per word per issue, and be sure that it will be read by thousands.

EGGS FOR HATCHING.

ORPINGTONS, BUFF AND BLACK. THE winners of the lion's share of honors at the Los Angeles County and Breeders' shows this year. The birds that win in the keenest competition and lay eggs all the year. Birds that pay as they go. Handsome catalogue free. Guaranteed fertile eggs in any quantity. Proven breeding stock very reasonable. Write today. Orpington Reservation. ROSS & TATE, Altadena, Cal.

THE CRY OF THE PINES.

Listen! The great trees call to each other
"Is it coming your time to die, my brother?"
And through the forest, wailing and moaning,
The hearts of the pines in their branches groaning,
We die, we die!

"We who have watched the centuries dying,
The span of years as an arrows flying—
Ages seeming a day and a morrow,
Lo, we have reached the time of our sorrow—
We die, we die!

"We, who have stood with our ranks unbroken,
Breasting the storms, a sign and a token
That the gale must cease, and the wild winds staying,
Man, we shielded, is come, and is slaying—
We die, we die!

"Flaying the bark, and our bodies baring,
Like dim white ghosts in the moonlight staring,
Naked we stand, with the life sap welling—
Tears of resin, to gather for selling—
We die, we die!"

All over the land are the forests dying,
One piece of silver a tree life buying—
Listen! The great trees moan to each other,
"The ax has scarred us, too, my brother—
We die, we die!"

TWO LITTLE SHOES.

HE HAD been full of an unreasoning anger all the day, and now "the sun had gone down upon his wrath." After the scene of the morning he had expected to find the house, when he returned to it at night, forsaken and alone, and he was not mistaken. No welcomeing light streamed out of the darkness, no little figure tripped arily back and forth from the small kitchen to the tinier dining room; no bright, loving sunny face met him at the door with a fond kiss and a glad word of welcome. Everything was still and chill and silent.

He had taken no supper down town and yet he was not hungry. He had been to miserable to eat, having not yet arrived at that mile-stone in married life when a quarrel and an appetite are both possible. As the door swung open to his latch key he hesitated before entering, dreading the gloom and darkness awaiting him. As he stood there doubting and uncertain, round the house came the pit-a-pat of four soft, eager feet, and the next moment Madge's water spaniel rubbed against him with a sharp, ecstatic bark of welcome. He stopped to stroke the chesnut coat, then gaining courage, a second later, entered the house, the dog closely following. He groped his way to the mantel, struck a match and lighted the tall lamp. As the soft mellow radiance fell upon each familiar object of the pretty room Derwent groaned. How empty—how cheerless it was, devoid of the witching, graceful lovable presence of her who was its mistress.

"I shall not be here when you return to-night," he heard her sobbing voice say again. "You are unkind and unjust, and I have not deserved it. When you can treat me as a wife should be treated, how her eyes had flashed through her tears) I may come back, but not till then."

And she had been as good as her word. He went out of the little parlor and into the room Madge called her own. Her morning gown was flung across the foot of the bed, and there, close by her chair, stood a pair of little shoes. There was nothing remarkable about them in the least, yet, as Derwent gazed upon them, his eyes filled. They were brown in color and edged with fur and small. They must needs be to fit the fairy feet that ran about in them al

ter. Good night, Aunt Barbara, come over and spend the day with us soon. Madge is a prime housekeeper and does you credit."

Aunt Barbara laughed, well pleased, and, forbidding her to come to the door to see them off, they passed out into the night. A silence fell between them, then suddenly Derwent felt in some mysterious fashion that Madge was crying. The street was a dark and quiet one and Derwent took her in his arms.

"Don't cry, dearest," he whispered, remorsefully. "I alone have been to blame. Forgive me this time, sweetheart; I'll do better in the future, only try me."

For answer Madge pressed her head against his breast. "I've been so miserable, Jack," she went on quivering, "you can't guess how miserable. I was so frightened after I had really gone, but Aunt Barbara, dear unsuspecting old soul, did not know. She thought I had come to spend the day. Ah, you can't guess (with a little shudder) what a wretched, wretched time this has been.'

"Can't I?" answered Derwent, with a grim smile. "I think I too have suffered something to-day, little wife."

They entered the little house together, and again Derwent lighted the tall lamp Then he turned and placed his trembling little wife in her low chair. He took off her hat and cloak as gently as a woman. The lamp light fell on her bronze golden hair, her soft eyes, her red lips. How beautiful she was, he thought involuntarily. He stooped and unfastened the trim shoes, a trifle damp from the walk home, then he went into the little room beyond, returning with two little brown ones edged with fur. He knelt and slipped them on her pretty slender feet.

"How good you are," murmured Madge brokenly, "what brought you to Aunt Barbara's to-night, Jack? I sat there waiting, dreading, I know not what, fearful lest Aunt Barbara should guess the truth and question me. Ah, you can't guess the bliss, the relief your coming gave me. What made you do it, Jack?"

Derwent bent suddenly and kissed the littel foot in its brown shoes edged with fur.

"What made me?" he answered, a trifle huskily—"why two little shoes—my dearest."—Plain Dealer.

RECIPES.

Cream Cakes.

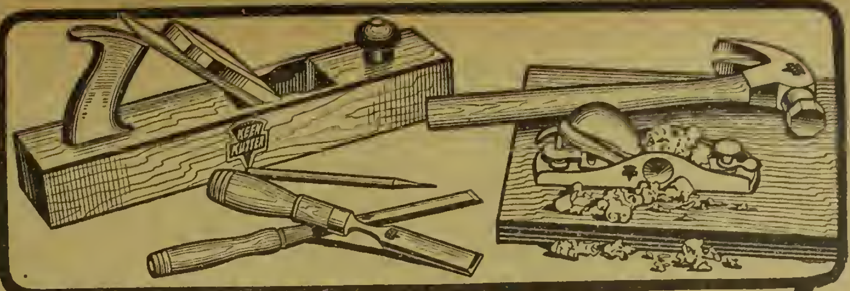
One cup soft sugar; one cup sour cream; one egg; one teaspoon soda; one cup raisins; salt; nutmeg; one and one-half cups flour; bake in patty pans.

Sandwiches.

One of the most delicious accompaniments to a green salad are cheese sandwiches toasted or sauteed. Grate the cheese, season lightly with salt, pepper and mustard, add enough creamed butter to transform into a paste. Spread thin between folds of white bread.

Tomato Rarebit.

To make a tomato rarebit take half a can of tomatoes, one-fourth of an onion, three cloves, one-third of a teaspoon of mustard, one-half teaspoon of salt, one-fourth of a teaspoon of soda, and cook for ten minutes. Add one-half teaspoon of cornstarch and strain. Add six ounces of grated cheese, and when melted serve on toast or hot crackers.



Tools of Accuracy

Tools for the workshop, farm or home must be tools of accuracy. A plane, for instance, to smooth a board properly must have a keen blade, carefully adjusted—its surface must be true and it must fit the hand.

KEEN KUTTER
Tools and Cutlery

E. C. SIMMONS KEEN KUTTER TRADE ST. LOUIS U.S.A. MARK

are tools of accuracy. Every ounce of weight—every line, every handle, every blade is carefully adjusted, and tested before leaving the factory. The trademark on each guarantees it to be satisfactory or money refunded.

The name Keen Kutter includes Carpenter's Tools and a full line of Farm and Garden Tools—Forks, Hoes, Scythes, Trowels, Manure-hooks, Lawn-mowers, Grass-shears, Rakes, etc. Also Scissors and Shears, Pocket-knives and Table Cutlery.

Sold for nearly 40 years under this mark and motto:

"The Recollection of Quality Remains Long After the Price is Forgotten."—E. C. Simmons.
Trademark Registered.

Western Gas Generators

The most reliable and cheapest GASOLINE GAS GENERATOR ever put on the market.
For Lighting, Cooking and Heating. This Generator is used by the largest hatcheries in California for Incubating and Brooding.
AUTOMATIC, SAFE, ECONOMICAL.

Read what Mr. A. W. Foster, President of the California Northwestern Railway, has to say about them:

Gentlemen: Replying to yours of the 20th inst., I would state that the plant installed for me by the Western Gas and Power Company on my Hopland Stock Farm, is giving entire satisfaction, and I cannot speak too highly of it. Yours truly,
A. W. FOSTER.

Mr. Foster used an acetylene gas generator before we installed our Western. Send for our latest Booklet.
Good reliable Agents wanted.

We Need Good Light

We will all agree to that. We owe it to our eyes and to those of our family.

Acetylene Gas is the best. Ask the Scientific American. Cheaper than coal oil, candle power for candle power. WE WANT YOU TO KNOW our 1908 Model as we and hundreds of others know it. And for that reason we will ship one or place it in your home on 30 days' free trial and trust you to give it a square deal. Ship it back at the end of that time or make settlement.

IS THIS FAIR? Machines in four sizes—20, 35, 50 and 100 lbs. capacity.

If you can sell a few machines in your locality we will tell you something else that will look good, when we hear from you.

Write today. Yours for a square deal,

Hay.

Somers & Co. report:

A car of new hay made its appearance on the market on Monday, April 27th. It was a mixture of alfalfa, oat and clover hay and sold for $10.00 per ton. It can hardlly be recorded as signalizing the appearance of the new crop, for oftentimes alfalfa is shipped here during the latter part of April, whereas new straight grain hay rarely makes its appearance before the latter part of May.

With moderation in the buying fever, prices are somewhat lower, especially on choice grade goods.

Choice wheat hay	$16.50 to $18.00
Good wheat hay	14.00 to 16.00
Other grades same	11.50 to 13.50
Wheat and oat	12.00 to 16.00
Tame oat	11.00 to 16.00
Wild oat	10.00 to 14.00
Stock hay	8.00 to 10.00
Alfalfa	9.00 to 12.50
Straw, per bale	.50 to .90

Grain.

'Nuts, fruit or predigested junk?"

'None of 'em. Three square meals day and a snack betwen times if eel like it."

THE CALIFORNIA LEMON.

Continued from page 525.

vigilance, thorough study of the habits of the numerous insect pests put here for the entertainment of the citrus grower, and the best methods of keeping them in subjection.

The same care must be observed in the packing or curing house in handling. Lemons should be held in the curing house at least a month before shipment so as to eliminate by decay the weak and injured fruit. During their stay in the house, they must be properly ventilated. Excessive moisture should be eliminated, and shriveled fruit avoided. This means careful attention. If held in the house any great length of time, decays must be removed before getting too soft. Before shipment, the fruit must be carefully graded, honestly and neatly packed.

A Gopher Under Every Tree.

I know of nothing that will respond to good care better than a lemon orchard. About a year and a half ago, I purchased a property on which was a ten-acre lemon grove that had been very badly neglected. The grove had never been irrigated during the summer months, since planting; the trees had never been pruned or fertilized; neither had anything ever been done for insect pests; neither had it ever had a good cultivation. There was a gopher under almost every tree. You can imagine the state it was in. I debated in my own mind whether or not it would not be better to grub the grove out, but decided to give it a trial, and see what good care would do for it. I immediately gave it a heavy pruning and thorough fertilization, cleaned up the insect pests, and have kept it well cultivated and irrigated since. During the first year, the place netted about $1500 above all expenses of putting it in good condition. It is now full of lemons and bids fair to make a very good grove.

Don't Be Stingy with the Trees.

The trouble with some growers (of course there are none of them here) is that they are too penurious or too short-sighted to spend enough money to properly care for their groves. Perhaps you will be interested in the following expense account of my 20-acre lemon grove, which produced 18,932 fifty-pound picking boxes during the year 1907:

Tools and implements, 20 per cent charged off	$ 68.54
Frost plant labor	11.04
Harness, 20 per cent. charged off	11.38
Expense—Bookkeeping, telephone, office supplies, etc., including $25 per month charged to orchard for my management	662.77
Horse feed, cost	251.31
Cultvation	276.38
Picking lemons	2307.66
Pruning	164.43
Irrigating	363.65
Fertilizing	545.28
Total	$4662.44 or $233 per acre.

I have mentioned a few of the most important things. There are others necessary to success, but if the average grower will follow the blazed trail and give the same watchful care and attention to detail that is given by the average successful business man to his business, he will succeed.

C. C. TEAGUE, Santa Paula.

THE PROBLEM.

"Do you think it is as easy to make a fortune as it used to be?" asked the ambitious youth.

"Easier," answered Senator Sorghum. "The problem is to do it in such a way that your friends will continue to speak to you."—Washington Star.

It doesn't take much bendin' tu break most men.

It's Service You Really Pay For in a Studebaker

There is more real economy in buying a Studebaker farm wagon than in paying a lower price for some cheaper make. A Studebaker has quality and gives real service. It is built to last and does last as thousands of farmers will testify. Every vehicle is dependable—honest in material—honest in make. That is why the farmers of the country have made the Studebaker the largest vehicle factory in the world.

See the Studebaker Agent and ask him to show you the Studebaker line of farm wagons, farm trucks, buggies and harness. If you don't know one, write to us. If you mention this paper and send us two cents in postage, we will mail you "Studebaker" 1908 Farmer's Almanac—FREE.

An Arizona Cowboy Outfit

THE COWBOY'S SWEET BYE AND BYE.

Last night as I lay on the prairie
And looked up to the stars in the sky,
I wondered if ever a cowboy
Would drift to that Sweet Bye and Bye.

The trail to that bright, mystic region
Is narrow and dim, so they say;
But the broad road that leads to perdition
Is staked and is blazed all the way.

They say there will be a great round-up,
And the cowboys like dogies will stand,
To be marked by the Riders of Judgment,
Who are posted and know every brand.

I wonder was there ever a cowboy
All right for that great judgemnt day;
Who could say to the Boss of the Riders,
"I'm ready, come drive me away?"

For they're all like the cows that are locoed,
That stampede at the sight of a hand,
And are dragged with a rope to the round-up,
Or get marked with some crooked man's brand.

I know there's many a stray cowboy
Who'll be lost at that great final sale,
When he might have gone in to green pasture
If he'd heard of that bright, mystic trail.

And I'm scared I will be a stray yearling,
A maverick, unbranded on high,
And get cut in the bunch with the "rusties,"
When the Boss of the Riders goes by.

For they tell of another big owner,
Who is ne'er over-stocked, so they say,
But who always makes room for the sinner
Who drifts from that straight, narrow way.

And they say he will never forget you,
That he knows every action and look;
So for safety you'd better get branded—
Have your name in the big Tally Book.

—Out West Magazine.

COULSON'S

CRESOLENE

Lice Killer Disinfectant and Dip

❀

Dilute With Water Before Using

❀

CRESOLENE is a powerful disinfectant, insetcicide and germicide obtained from coal tar. It is non-poisonous, and non-corrosive and will do no harm to the most delicate skin.

It mixes readily with water, forming a milky emulsion, and can, therefore, be diluted from 50 to 100 times its own bulk, in accordance with the different uses to which it is put.

Thus when you purchase 1 gallon of CRESOLENE you can make up to 100 gallons of the best disinfectant at a cost of only 11-4 cents per gallon. Write us for particulars and guarantee.

PRICES: Quart can 50c; One-half gal. 85c; Gallon $1.25.

Pomona Pressure Gates

A Great Aid in Irrigation

These gates are made similar to the ordinary slide gates except that there is a locking device interposed to lock the cover in any desired position or to press the two faces together to make a WATER TIGHT joint, from either direction when closed. The parts are very simple, only a tapering screw with a split tapering nut socket. By turning the handle to the right tightens, and to the left loosens the cover or it may be removed entirely.

intaining Fertility in the Orchard

An Address by Frank L. Palmer of North Pomona Before the State Fruit Growers Convention at Riverside, May 1, 1908

ress delivered at the recent State Fruit
nvention at Riverside, is the one about
ames Mills remarked. "That address, I
classic in the literature of fertilization.
nore information on the question of fer-
an any similar number of words, I ever
ould be in the hands of every fruit grow-
tate."
er has been superintendent of the large
nge orchards at North Pomona for many
s built it into a magnificent estate. One
s thorough study of the soil both as to
content and its mechanical condition.

ve heard a good deal in recent years
t wornout and unproductive farms.
t the year 1890 the so-called "aban-
s" of New England came into special
by reason of the fact that some of
ngland States issued lists of such prop-
e; these lands having been sold to the
npaid taxes. The title of the pamphlet
the State of Massachusetts was this:
e List of Farms in Massachusetts
or Partially abandoned." Conneticut,
shire and Vermont issued similar lists,
ate report for Maine the large number
h farms is mentioned.
tive farms are not confined, however,
w England States. We know, as a
us fact, that the once rich prairies in
l other States of the wheat belt, have
impoverished by continuous cropping
nd is now yielding less than half the
bushels of wheat it produced forty
Many farmers of Illinois grew wheat
e fertile lands year after year until
ld no longer be profitably grown, then
d on to Nebraska and the Dakotas and
he process, and the same class of farm-
ill moving on to seek virgin soil in

man's wasteful method. But let us
a moment from man's methods to nat-
hods. In a state of nature do we find
out by reason of its having been taxed
heavy growth? The early American
pushing their way toward the West,
out forests, clearing timber lands and
g them into farms, did not find this
ovished because it had been growing
shing a forest. No, in nature fertility is
ed by nature's own processes. "In nat-
elements of fertility which have been
n from the soil by plants in their growth
ned to it by their death." In the case of
t lands the original fertility of the soil
only been maintained but vastly in-
by the decay of leaf mold and other
n, and the subsequent formation of
n the soil. Here then we perceive the
of a natural law of replenishment or res-
This law, ordained by the Maker of the
and observed in nature's own processes,
obeyed by man. We must restore to
those elements that we remove from it in
r, failing to do this, we shall bring pov-
on ourselves and upon those who are to
s.

nity for Investigation.

ese facts are perfectly familiar to us.
s no need, before an audience like this,
any argument to emphasize the necessity
ization of our soils. We recognize the
y; we are willing and even anxious to
he law of restoration, but when we ferti-
farms and our orchards we desire to do
ly and intelligently, and we find the sub-
dged about with some difficulties, and con-
problems still unsolved.

It is an interesting fact that it was only about one hundred years ago that the sources of plant food began to be correctly understood. Prof. Snyder says in the introduction to his admirable book that while manures had been used from the earliest times, and their beneficial effects recognized, their action was regarded as mysterious, so much so that the alchemists preached a theory that so-called "spirts" left the decaying manures and entered into the plant, thus acounting for its more vigorous growth. Continuing, he says that among the first to see the relation between chemistry and agriculture was Sir Humphry Davy, who published a treatise on the subject in 1813. Since that date vast strides have been made in the proper understanding of the composition of plants, and of the sources and composition of plant food. Years of study and investigation have been given to the subject by eminent men of many countries, and through the investigations and extensive field experiments carried on by such scientists as Von Liebig in Germany, and Lawes and Gilbert in England, the world at large attained much of its enlightenment which forms the basis of our present day knowledge of these subjects.

Coming down to our own time and to the present day, I think it may be confidently said that a distinct advance has been made in our orchard practice by us farmers here in Southern California during the past twenty years. Fertilization is practiced much more wisely and intelligently, I feel sure, than it was fifteen or twenty years ago. In no respect is this more true than in the general awakening to the value and importance of humus.

Humus.

Humus has been aptly described as the "life of the soil" and this is true in a very literal sense, for it is the home of the bacteria of the soil, those wonderful little organisms which convert the inert fertilizing elements into forms which are available as plant food. When the humus of a soil becomes exhausted, or burned out, these micro-organisms cease to do their work; and under these conditions our trees may be insufficiently fed even though a plentiful supply of fertilizers may have been applied, and this is because of the fact that the tree roots cannot take up fertilizers in the forms in which we apply them. Almost all the fertilizing elements that we use have first to be converted, by the action of the soil bacteria, into other forms that are available to the tree.

What are our conditions here in California? We have a semi-arid region. Our soils contain, as a rule, plenty of lime and potash, but are very deficient in humus and nitrogen. It thus becomes of vital importance that we conserve our humus supply, and add to it in every feasible way. I consider that for our arid region the basis and foundation for all successful fertilization is the maintenance of a supply of humus.

How is this to be done? I know of only two ways. One is by liberal applications of stable manure, or straw, alfalfa hay or other mulch, and the other is by the growing and plowing under of cover crops.

Stable Manure.

The fertilizing effects of stable manures is far in excess of what we would expect from simply studying the amount of plant food contained in the manure. Dr. Wiley of the Agricultural Department has this to say on that point: "The action of stable manure is another instance of the great benefit which is derived from manuring a field with nitrifying organisms. It is well known that the nitrifying ferments of decomposing stable manure are particularly numerous and vigorous. It has long been a matter of wonder among agronomists to find stall manure, when scattered over a field, producing fertilizing results far in excess of what could be expected from the quantity of plant food contained therein. In the light of the facts set forth above, however, these results are no longer surprising. In the distribution of the manure large numbers of a particularly vigorous species of nitrifying organisms are incorporated with the soil, and these and their progeny continue to exercise their activity upon the inert nitrogen of the soil when the more easily nitrifiable portions of the stall manure are exhausted."

Let us, then, use stable manure, and accord to it the high appreciation that it deserves. It is a most valuable fertilizer, particularly for use in old orchards, where, owing to the size of the trees, it is difficult to grow cover crops successfully. Before leaving the subject I desire to add, however, that I do not regard the exclusive use of stable manure as desirable. It is a one-sided, unbalanced fertilizer, being rich in nitrogen as compared with phosphoric acid and potash. In its action it will combine with its nitrogen the available potash and phosphoric acid already in the soil, and year after year the available supply of these two constituents will become less. A bulletin of the New York Station cites the fact that the soil of many farms in that State have actually become exhausted by this process, where the exclusive use of stable manure has continued for long periods of years. Therefore, when using stable manures continuously, it seems to be evident that we should use some form of phosphate with it, and possibly both phosphate and potash.

Cover Crops.

I mentioned the use of stable manure and the growing of cover crops as the two best methods for maintaining the requisite supply of humus in the soil. Cover crops easily rank first in this particular; and, besides furnishing a supply of humus, they are also of great value and importance in other respects. The particular value of clover, peas, beans, vetch and other plants of that family for adding fertility to the soil has been known for hundreds of years, although the reason why these legumes possessed superior qualities in this respect over other plants, is a discovery of modern times. In his bulletin on soil inoculation Dr. George T. Moore has these interesting quotations from the writings of Pliny the Elder: "The bean ranks first among the legumes. It fertilizes the ground in which it has sown as well as any manure. The vetch, too, enriches the soil and requires no attention in its culture."

But the ancient Romans knew only the fact that these legumes acted like manure; the true reason for the fact remained a secret and baffled many investigators and not until the year 1886 was it definitely proven that the legumes are able to acquire and store up nitrogen from the air. This discovery is ascribed to the German scientist Helriegel. Later still it became definitely known that this fixation of nitrogen from the air is accomplished by means of bacteria which gain entrance to the roots of the legumes. Great inter-

With the Citrus Growers

ORANGE LOSSES.

THE questions of split oranges, July droppings and coarse fruit, are constantly being raised, even though they are old ones and generally considered one of the unavoidable losses that go with the orange business.

Theories that might explain the cause of splitting may be of value in working out the cause but they are of no practical use to the grower unless something definite is realized. While climatic conditions may have certain bearings on the case, there are other elements that surely contribute. This is evidenced by the fact that one orchard will have more split fruit than another though they may be only a few rods apart. And again certain trees will be more affected than an adjoining one in the same orchard and likewise some branches of the same tree will produce a much higher percentage of splits than other branches. There has been advanced the theory that irregular irrigation or lack of moisture or plant food might cause splitting of the fruit. On our lawn is a Washington navel tree that has not suffered or known the need of moisture or plant food for eighteen months, but over 30 per cent of the fruit split this season. The soil has been heavily fertilized with dairy manure and the tree has shown a remarkably uniform vigor from a time before the blossoms came that made the fruit.

Not a little loss is occasioned by coarse fruit that comes from the late bloom; that is, that which comes out from June till late in July. This is very often caused by the trees being short of water at certain times during the summer when climatic conditions are right for blooming. It is not uncommon to see orange trees come into bloom soon after a copious irrigation following a drouth. During the series of dry years that occured in Southern California during the nineties, summer bloom was more universal and abundant than it ever has been since. Many groves suffered because irrigation water was not available in sufficient quantities to keep them in a thrifty condition. When water was turned on the effect was to start a new short growth with more or less bloom.

The quality of this "off bloom" fruit varies in different seasons. Some years it will ship well as standards while this year, for instance, it is exceedingly coarse and dry.

MAKING SWEETS BEAR.

We have heard many complaints of Mediterranean Sweets not bearing and discouraged growers have come to us for relief. Sweets are very erratic in respect to bearing, and while there is no apparent reason for this, no doubt the soil has something to do with it. Trees with ordinary care are in some places as profitable as good navel trees adjoining. In another district they will not pay expenses though to all appearance they are on better soil and the care they reecive gives big returns on navels in the same grove.

There is an orange grove, navels, in Pomona that had a bad record for bearing for a number of years; in fact never had borne enough to pay expenses up to the time it was seven years old. Certain trees were particularly shy in bearing and the owner in desperation cut around the trunk just above the ground with his pocket knife so as to girdle the tree to the extent of cutting the bark clear through but not removing any. This was last spring and to his satisfaction he has a good crop this year. The fruit is not as firm as it might normally be. In January it was rather soft, and though not of very high color, the fruit was as good in this respect as much that grows normally. The permanent effect on the tree does not seem to be serious, only a ring of rough bark showing where the cut was made.

We do not recommend this method to orange growers who have trees that do not bear, but if we had trees that acted that way we would surely try it on a few of them after other methods had failed. Girding is a practice followed in the past more than at present, by many apple growers in the East. This has been demonstrated to be poor horticultural practice inasmuch that proper thinning will make an even distribution of blooms throughout a series of years. In the case of Mediterranean Sweet oranges, it is quite a different problem as there is seldom a dearth of blooms which fools the grower by setting a good crop which proceeds to fall off a little later.—J. W. Mills.

Packing House Equipment

Delivered at the State Frut Growers' Conventon.

BY C. E. RUMSEY OF RIVERSIDE.

Mr. Rumsey is a believer in up-to-date methods. His belief is carried out in action and his packing house is a model of convenient arrangement.

HAVING been drafted by the State Commissioner of Horticulture to speak on "Packing House Equipment," at this convention, I have accepted the duty under protest. My experience as a packing house manager does not qualify me to tell men of long experience, and in entirely different situations from my own, what they do or do not need. I can at least open the subject and give some details from my own experience.

The most important item of equipment is not machinery, nor any contrivance or device to hurry our perishable fruit from wagon to car. I would place absolutely first a body of growers who would demand from the packing house management that the fruit they had labored nearly a year to bring to perfection, should be handled as to prevent its decay while on the way and after its delivery to the buyer.

While packing house managers have been open to blame, (mainly for consenting to handle fruit improperly,) it would be very hard to find a manager who would resist an effort made by his growers to insure greater care in handling. In my experience the grower is to blame, not the manager. Some growers will help the manager by picking and delivering fruit in the most careful manner. Other growers will do neither, and their neglect when their fruit is

o enable the men to put these
bottom of each tier, so we can use a truck with a twelve-inch nose to convey six boxes at a time from the wagon across the end gate (now used as a bridge) from load to packing house floor. My time is probably up, but I have given what I consider the most important of "Packing House Equipment."

The elevator, the clamp truck and the rustler, were all undesirable features in equipment. We have cut out the elevator by dropping the floor of the house below the grading table twenty inches, so we feed on to the sizer almost horizontally. When necessary to weigh, we empty the bins and use small platform scales. All our culls are carried to a bin and reinspected by the foreman. I think I pay his wages out of the cull bin.

We use no brusher; if fruit is dirty we grade it out and clean it. If one child is sick, it is better to dose it and not give medicine to the entire family. At the dump we have a piece of canvas with a board attached so that it meets the box as it comes up and covers enough of it to make the oranges crumble down inside the box instead of flying out. They fall on rubber hose spaced apart to let buttons, sticks, etc., fall through at once, but clean picking has almost cut them out. The hopper below the hose grating is smooth, hard board as the fruit does not fall on it.

We use Praed canvas bins. When packed the boxes are placed on ball-bearing roller conveyors, 26 inches high, the height of the press. The fruit is clamped sideways, away from the edge of the box before it is pressed down, and it seems to prevent injury when carefully handled. When nailed the boxes are shoved on the conveyor and run by gravity into the end of the car if needed, or off to the side of the house to be stacked.

Not all of the work in our house is adapted to all other houses, but the determined growers, the intelligent manager, the picking crew, the careful hauling and handling, are after all the best equipment for any house, and when you have these, no device that can possibly injure fruit will be tolerated.

Let us pick and pack our fruit to save ourselves loss; now that the Department of Ariculture has spent $36.-000 to show us how to minimize decay; knowing that the trade will pay

---

ATHLETES EAT ORANGES.

Atheletes at the University at Oxford, England, have found that oranges used as a regular feature of their diet have aided in maintaining health. Orange juice is said to be also an antidote for the influenza germ, and does actually supply muscle to men in training, or at least assists in the formation of muscular tissue. The men are encouraged to eat of them liberally.

THE RANCHER NEEDS IT.

"We are well pleased with the Cultivator. There are, so to speak, a hint, a piece of advice, and many instructive articles for the knotty problems of the rancher's busy life. It's just what ever rancher needs to read. It'll help him in his business."—Ernest D. Wheat, Penryn.

THEY ALL GET IT.

"The best paper I take and neighbors all get it."—A. E. Griswold, Hanford, Cal.

FIRST-CLASS.

"Think you are getting out a first-class paper and wish you continued success."—Morris Keller, Reedley.

Deciduous Fruit Cultu

CROPS BETWEEN TREES.

THE practice of growing crops between orchard trees is a most economical method where a convenient and economical water supply is at hand. The independent pumping plant is the ideal water supply for this kind of farming. If there is no water supply available to irrigate an orchard or inter-growing crops, it is bad policy to attempt it as not only will the trees become dwarfted, but the inter-crops will not be as good as though they had all the ground to themselves. We once planted a peach orchard and the same spring planted watermelons between part of the trees. Both made an excellent growth, the melons bringing $60 per acre, but the peach trees shed their leaves a month before their time and from then on as long as the peach trees were alive, those among which the melons grew, never bore as well nor as much as did the trees in the balance of the orchard where no melons were planted. This condition continued all during the life of the orchard.

It is best not to grow any crop so close to the tree rows that a strip four or five feet wide cannot be cultivated on each side of the rows and in conjunction with this enough irrigation to keep both trees and crop in a thriving condition, with a liberal amount of stable manure, there is no reason why the inter-growing crops in a young orchard cannot be made to not only pay for the care of the trees till they come into bearing, but yield a handsome profit besides.

It was not many years ago that the growing of alfalfa between orchard trees was considered poor practice, but it is now quite common and in some cases where the fruit crops had always been light, the result was an improvement in the yield, besides the several crops of alfalfa hay. These conditions can only be realized when plenty of irrigation water is available. —J. W. Mills.

Packing House Equipment

Continued from Preceeding Page.

us well if we save them loss. When dealers find out that most decay is preventable, it will be hard to sell fruit that has been carelessly handled.

I presume "Packing House Equipment" was assigned to me because the Commissioner thought there was something unusual in my house in the way of "equipment." There is little in it that is original; it is only the adaptation of other men's ideas, picked up here and there, but always with the purpose of simplifying the work and handling fruit with care. We have coddled the lemon and abused the orange. Having no lemons we coddled what we had and the oranges got the easy handling. They have responded as Mr. Powell predicted they would, and the market seems to have appreciated the care. I think the packing house equipment has been a small factor only. It is care, not equipment, that has done most to lessen decay. No equipment will take the place of anxious, systematic care from the tree to the car. I am forced to this conclusion by finding houses which have a less careful equipment than ours, but whose field care and hauling is of the best. I would rather take any packing house and pick, haul and pack for it with care, than take the costlie ment designed for careful and rush fruit through it so c not be given.

It was a mystery to me Chapman could sell orang high prices. Then it beca tery how the National O could get such figures. Then Brown put me in a brown began to remember that Mr. P said nearly four years ago t Chapman was the most caref er in California. As I knew t ional Orange Co. and Mr. Brow following Mr. Powell's suggest proof seemed positive that the something in it.

Later I knew of a packer "Mr. Powell is a humbug." I in the market report and saw packer's fruit sold at $2.40 for fancy, when three orchard run for over $3.00. That proved it tively, and I built a house with a shield on the corner, on whic gold letters, is inscribed:

"In gratitude to the U. S. Dep ment of Agriculture, the Bure Plant Industry, G. Harold Powell his staff, this building is dedicat the careful handling of Citrus Fr

Countries Awake.

ere are signs that in this mat- her countries are awake to their peril and responsibilities. British Columbia is taking Time by the forelock and, by a sweeping act, reserving for governmental control every acre of forest land not already leased. Colombia, in South America, has also passed new forest laws in keeping with intelligent modern public opinion. The conference cannot directly legislate, but its recommendations and influence ought to shape a policy of coöperation between the nation and the States along uniform lines. The Appalachian bill is a step in the right direction, and ought to be enacted, but we must go farther, considering the forests of the country, with all due respect to private ownership a heritage of posterity.

Madness to Defer.

"An important and commendable step has just been taken by the State of New York in the purchase of Mount Marcy and other peaks of the Adirondacks at the very headwaters of the Hudson This policy should at once be continued until the reservation reaches its maximum extent. Then the whole tract should be administered under a system which, while guaranteeing private rights, will give the State supervision of the cutting of trees. The public health, the interests of agriculture, commerce and navigation in New York and Pennsylvania call imperatively for a large-minded and immediate consideration of the whole subject. "Be wise in time; 'tis madness to defer."

THE CONFERENCE OF GOVERNORS.

The consumption and waste of our natural resources is proceeding apace. But whenever efforts have been made to meet this situation, difficulties have arisen from the facts that the conditions of one community are affected by the actions of another over which it has no control; but the preservation of one form of natural wealth involves the protection of others, and that none can be managed independently of others. Effective action has been blocked because there has been nobody broad enough to formulate a plan sufficiently comprehensive.

Such a body is now provided by the conference on the conservation of natural resources, which the President has called to meet him in the White House on May 13, 14 and 15. This conference will represent every part of the country, and all the country's needs. By direct personal contact, the members will be able to come to an understanding of the various inter-related problems and of what will be required of each part of the country to make a general scheme possible.

This conference will be the most remarkable in the historic-mansion. It will deal with problems upon which the continued prosperity of the nation vitally depends. For this reason its deliberations will be more fundamentally important and far-reaching than any since the days when the republic was planned. Never before have the chief executives of all the States met in one body presided over by the Chief Executive of the Nation, and never before has there been a subject bigger or broader to cause such a meeting.

The steps which led to the calling of this conference are particularly instructive in the way in which they emphasize the close inter-relation and inter-dependence of all the natural sources of the Nation's wealth, and the fact that any attempt to conserve one set will soon involve the protection of others.—Forestry and Irrigation.

YOU CAN IRRIGATE YOUR UP-LANDS WITH AN I. H. C. GASOLINE ENGINE

NO need to go up stream and construct miles and miles of ditch to get the water high enough.

Place one of the powerful I. H. C. gasoline engines on the stream where it is nearest your land. There are large engines for irrigating on a big scale and smaller engines for small farms.

These engines are the best means for raising and utilizing the underflow; also for raising water from lakes, ponds, and wells, and also running streams.

They will raise all the water you need and deliver it just where you want it—in the ditch or in laterals.

The first cost of one of these I.H.C. gasoline engines is, in almost every case, less than the building of a long ditch to enable the water to flow naturally to the land.

And the cost of running is always less than the cost of keeping the ditch clean of drifting sand, silt, weeds and fast growing bushes.

In many cases, an I. H. C. engine enables you to reach the knolls and other high places which you cannot reach at all by ditch without expensive flumes that are "tumble-down" and must be repaired every spring.

The engines are made both vertical and horizontal and in many sizes from 1 to 20-horse power. They are easily controlled and run dependably. The irrigator does not need to give them constant attention.

Only an occasional return to them, to replenish the fuel and water supply, is all that is necessary. One man can handle the head of water in the field and at the same time attend to the engine.

International local agents will furnish catalogs and give particulars on all sizes of irrigating engines. Or write the nearest branch office.

The Ornamental Garde

SHRUBBERY.

influence. It supplies the happy IN the arrangement of the home grounds shrubbery lends a valuable medium which blends the taller, stately trees and the smaller perennial and annual flowers of the informal border into one harmonious whole. And the whole affords a most desirable setting for the house, which is the fundamental feature of the home.

With almost equal advantages it can be independently used for manifold purposes, as hiding the bleakness of house, screening unsightly objects, such as chicken yards, out-houses, ash lattice work, filling vacant corners about the grounds, relieving the bareness of the nooks and corners of the pits, or even the premises of a less tidy neighbor, defining the boundary of the formal flower or vegetable garden, and such other purposes as may suggest themselves to the eye of the beautifier.

In establishing shrubbery beds for any of their various purposes it is desirable that the more sturdy, vigorous kinds be placed in the background, or in case they serve a double duty, the taller may be placed in the middle of the bed, so as to provide a gradual blending of the whole with the more delicate and refined types in front. Avoid setting in rows; rather uniformly group them in broken lines.

As a general consideration, one should not attempt too great a variety of shrubs or grow them as isolated specimens, particularly in the open lawn in front of or about the house. Such specimen plants should be placed in more selected spots where they will not mar the landscape by their abruptness. However, several varieties or types of shrubs may be grown about a small place, if care is taken to see that the foliage and floral features blend into a harmonious whole. Peculiar or freakish specimens should be avoided about a small place. For the ordinary home a few well-selected types properly disposed about the grounds will give more desirable results, and there is really no valid reason why every home should not be appropriately beautified and brightened by the addition of at least a small amount of shrubbery. After becoming established, but little attention is required and the expense is small. However, the shrubs will respond readily to more careful attention, and such care will serve to relieve the drudgery of the farm home and add zest to the city residence.

In making the selection of stock consult and deal with only the most reliable of nurserymen, being willing to pay a fair price for a good quality of article.

Having determined upon the location of the beds for the shrubbery, they should be well spaded to a depth sufficient for proper planting. Dig up the entire bed, adding a considerable quantity of stable manure, and if the soil is of a clayish texture, the addition of a quantity of sand will be beneficial. The whole should be well spaded, mixed and pulverized, in order to furnish a congenial environment for the shrubs which will gratefully respond to this good treatment.

Very many people do not place sufficient stress upon the care required in settling shrubs or plants of any kind. Nothing so endangers ultimate success as careless preparation of the soil, as well as subsequent setting of the plants.

In performing this last op be careful to remove all bruis broken roots with a sharp kn the same time cutting back th severely to a proper relation w root system. The roots sho spread out carefully in their position and covered with fin so the plant gently shaken up and in order that no open spa m main about the roots to in

THE PUMP THAT PUMPS

The Vegetable Garden

GREW ONIONS AS MILD AS APPLES.

IN buying onions in the markets, we were accustomed to getting the hot biting kind, though we tried every color, white red and yellow. To be sure we were able to buy Bermuda onions, but as these sold at a pretty stiff figure we were wont to buy them only when wanted for eating raw.

Studied the Catalogues.

When we had a garden of our own we began to study seed catalogues and read up on varieties of vegetables, onions included, and the high praise given the Prizetaker induced us to get some of the seed. As one-fourth pound could be bought for nearly the same price as a packet, we invested in the former quantity, thinking to save what was left over till the next year.

We had studied how to grow onions to such good purpose that we were able to prepare the soil and plant the seed as directed. When ready to give the final pulverizing of the ground before planting the seed a liberal sprinkling of wood ashes was scattered over the plot and carefully raked in.

We sowed the seed rather thickly, so as to be sure of a good stand, and still we had considerable seed left after the plot was planted. Learning from a reliable source that onion seed was not likely to germinate after it is two years old, we thought best to take no chances but plant the seed as directed for growing "bottom sets," though none of the catalogues mentioned using Prizetaker seed for this purpose.

As this is not intended to teach the process of growing onions, but rather to show how we succeeded in getting onions of mild flavor, I will pass on to the end of the season, saying only that where the onions were too thick to do well we transplanted the thinnings. setting the young onions about four inches apart, and, by the way, these transplanted onions made large, fine bulbs the equal of the others.

As soon as any of the onions were large enough to use, we pulled those that interfered with the room needed by their neighbors until they stood three to four inches apart. The young onions were tender and of delicious flavor, and when the remaining ones were matured we enjoyed raw onions as we never had before, except when eating Bermudas.

Stored the Sets.

The sets were pulled and stored away carefully for planting the following spring and we will pass on to that, as that is the real sequel of this tale. We had thought the hand weeding of the small onions a very tedious affair, for the seed being very slow of germination the more quickly sprouting weeds lying near the surface soon quickened into growth and were visible long before the onions were. But in spite of this we planted some seed again, as we were not sure how our venture with the sets should turn out, and we did not wish to be deprived of our precious mild-flavored onions, the liberal eating of which had saved us more than one call from the doctor.

Planting the Sets.

The sets were of different sizes, so we sorted out the largest, those from three-fourths to an inch in diameter, and planted these by themselves. The others, which were about a half inch in diameter, were planted in rows about 16 inches apart with a little greater space between them than between the onions grown from seed the previous year. We wished, if possible, to avoid the tedious hand pulling of grass and weeds, and expected a narrow rake and hoe to keep the space between the sets clean, as well as the ground between the rows.

The soil was made very rich by heavy applications of poultry manure, which had been composted and was evenly mixed with the earth, and we were looking for some fine bulbs, but were hardly prepared for the wonderful growth these sets made. By the Fourth of July they were large as teacups, and when ripe the crowded each other in the row and averaged five inches in diameter. They were mild as apples and we found them in great demand in our immediate neighborhood, as the fame of "those mild-flavored onions" spread. We never again grew onions from seed, for we had found a better way, one which involved far less labor and brought more certain results.—Mrs. Mary Roe, in Coleman's Rural World.

RAT POISON.

Destruction of rats is strictly in good form these days and thoroughly good economy. Where they burrow or are confined in close quarters they may be destroyed with carbon bisulphide. A wad of cotton is saturated with the liquid and pushed in burrow which is then packed with soil to prevent escape by gas. This must not be used where there is danger of fire, as it is explosive.

A couple of formulas for poisoning are here given:

Barium Carbonate.

One of the cheapest and most effective poisons for rats and mice is barium carbonate or barytes. This mineral has the advantage of being without taste or smell; and, in the small quantities used in poisoning rats and mice, is harmless to larger animals. Its action on rodents is slow, but reasonably sure, and has the further advantage that the animals before dying, if exit be possible, usually leave the premises in search of water. Its employment in houses, therefore, is rarely followed by the annoying odor which attends the use of the more virulent poisons.

The poison may be fed in the form of a dough made of one-fifth barytes and four-fifths meal, but a more convenient bait is ordinary oatmeal, with about one-eighth of its bulk of barytes, mixed with water into a stiff dough; or the barytes may be spread upon bread and butter or moistened toast. The prepared bait should be placed in rat runs, a small quantity at a place. If a single application of the poison fails to drive all rats from the premises, it should be repeated with a change of bait.

Strychnine.

Strychnine is a more virulent poison, but its action is so rapid that the animals often die upon the premises, a circumstance which prohibits its use in occupied dwellings. Elsewhere strychnine may be employed with great success. Dry strychnine may be inserted in small pieces of raw meat, Vienna sausage or toasted cheese, and these placed in the rat runs; or oatmeal may be wet with a strychnine sirup, and small quantities laid out in the same way.

Strychnine sirup is prepared as follows: Dissolve a half ounce of strychnia sulphate in a pint of boiling water; add a pint of thick sugar sirup and stir thoroughly. A smaller quantity of the poison may be prepared with a proportional quantity of water. In preparing the bait it is necessary that all the oatmeal should be moistened with sirup. Wheat is most convenient alternative bait. It should be soaked over night in the strychnine sirup.

Poison in the Poultry House.

For poisoning rats in buildings and yards occupied by poultry, following method is recommended: Two wooden boxes should be used, one considerably larger than the other, and each having two or more holes in the sides large enough to admit rats. The poisoned bait should be placed on the bottom and near the middle of the larger box, and the smaller box should then be inverted over it. Rats thus have free access to the bait, but fowls are excluded.

SWEAR BY YOUR OWN SECTION.

Are you proud of your own community? If not, join hands and make it such that you and all your neighbors will be proud of it. The last man on earth which any community has any use for is the knocker. Abraham Lincoln once said:

"I like to see a man proud of the place in which he lives. I like to see a man who lives in it, so that his place will be proud of him. Be honest, but hate no one; overturn a man's wrongdoing, but do not overturn him unless it must be done in overturning the wrong. Stand with anybody that stands right, and part with him when he goes wrong."

There are few places in California which does not have abundant conditions which will go to make a productive and beautiful section if those who are developing it work to their limit and then are proud of their work.

Look at the Colorado Desert where conditions were the most forbidding it is possible to imagine, and the bones of many a man have been left on these plains to bleach because of the death-dealing heat of the sun. But that same heat, with the addition of water today, is making that one of the most wonderfully productive sections in the world, and you cannot come in contact with an "Imperialite" or resident of the Coachella valley but instantly they begin to brag of the wonderful country which is being developed.

"Be proud of the place where you live"

THE PARCELS POST BILL.

It was to be hoped Congress would pass the Parcels Post Bill before adjournment, but that consummation is hardly to be expected.

The rural delivery came as a much felt necessity and has proven highly satisfactory to the farmers of the land. It brought the farm into close communion with the town and city, and relieved it of the loneliness which has been the complaint of the rural residents, especially the women. It has added to the value of farm land because of its general utility.

Following closely upon the rural mail delivery is the telephone, which has still more closely welded country life to city conveniences. Almost every well appointed farm home is today the possessor of a telephone, and the value of the same is appreciated by the fact that the owner will not do without it.

The way to acquire the parcels post law is to importune Congress to pass the bill. The Post-office Department has recommended its passage and it rests in the pigeonholes of the committee to which it has been referred.

With the advent of the parcels post system when packages will be delivered by rural carrier at the rate of two and three cents a pound, the modern conveniences for country life will be about complete.

MORE PURE FOOD RULING.

Now the shoe is on the other foot, for the Pure Food Commission at Washington has drawn the line at importation of food stuffs which have been colored with sulphate of copper and chemists are investigating the effect of this coloring stuff upon the human system. This appeals to us as far more sensible than the objecting to fumes of sulphur which are all carried away in the cooking of dried fruits. However, our interests are at stake here which may seriously affect our judgment. But in any case we trust that all producers of food stuffs who are as honest as the California producers of dried fruits are, will secure justice in these pure food rulings. We also hope that the justice will be secured without making as strenuous a fight as was necessary with the California growers and also with less injury to the industry before the matter is started toward a sane solution.

APPROPRIATION FOR AGRICULTURE.

The Senate passed the House Agricultural Appropriation Bill which carried a total of nearly $11,000,000 excepting that it made an increase in it of over $1,500,000. This was after a controversy over the forest service which lasted for more than a week. Many Western senators attacked the appropriation for the forest service on the ground that the government was interfering with the rights of the State in withdrawing from settlement great tracts of land for reserves. Senator Teller of Colorado was one of the strongest in making this fight. The total appropriation for the forest service was $1,000,000 or twice as much as had been granted by the House, but this was half as much as was requested by the Service.

GROWN IN CALIFORNIA.

The movement to make a slogan of "Made in California" or "Grown in California" by the manufacturers and growers of this State seems to be attracting much attention and favorable comment. A catchy advertising phrase often has made wealth for the advertiser, and it is sure the word "California" will do to conjure with. It has been advertised the world around as but few other words. Let us increase it and take up the suggestion which has been advanced by the Curtis-Newhall Company of Los Angeles, and burn in a little deeper the word "California" by using the phrase "Grown in California" on all California fruits and products.

TO ELECT BOARD OF AGRICULTURE.

Oklahoma is the first State to recognize the organization of a State Board of Agriculture direct by the farmers. Under her new constitution it is provided that ten members are to be elected by farmers. By a recent act of the Legislature $101,000 was appropriated for carry the important work that has been assigned care of the board. The county farmers' In t the State quarantine laws affecting live sto the enforcement of other laws.

The outcome of the experiment will be wa with interest, for if it proves a successfu the likelihood is that other States will a their laws to conform to the idea in the homa constitution.

COVER CROPS.

Many sections of California, espec southern part, have extensively gro leguminous plant in the orchard to be under for green manure. This has bec almost universal custom in orange grow tions. The effect on the soil, both me and chemically, has been proven to be v eficial and the custom is continually e Now we note that apple growers of t mette Valley are treating their orchard same way and find great benefits from of this system. The restoration of hum soil not only lengthens the period wh be worked, but reduces very mate amount of work which must be done t in condition for sowing and planting. I probable that the grain grower, as w fruit growers, may derive great profit f ing under green manure.

BOUNTY FOR FOREST PLANTING.

An exchange makes a suggestion might be a good idea in this State to e the more liberal planting of forest trees exemption from taxes or by offering a b all new plantings which have been prope for until well grown. We believe it is a which will bear discussion on the part o tutes, granges and conventions to the e encouragement shall be given to more planting of trees. In Wisconsin all lands in for taxes and becoming the property State are at once planted to forests or ex for other lands to be planted.

FREE SEED UNDESIRABLE.

The free seed distribution scheme government has proven unsatisfactory. to be abolished. It doesn't belong to vanced age of methods or ideas. It costs ernment a great deal of money annually tain the seed bureau, and it doesn't ju cost, when the character of the seeds into account. Most of the seeds received people throughout the country amount to tle for many reasons. The majority of p prefer buying or otherwise securing the they need according to the individual need money expended by the seed bureau if other lines of improvement, like the par would be of infinitely greater value to th

---

The management of the apple show at Spokane, Washington, December 7t have announced that a purse of $1000 in be awarded for the best single apple e This is a big winning from the exhibit a single fruit, but it will doubtless result in amount of study and observation as to w stitutes a perfect apple.

Central California

Merced is soon to have a new cannery established.

Peach moth has been discovered in orchards of Kern county.

Present indications are 4500 carloads of apples in the Pajaro valley.

The Turlock Journal still insists in making the statement "Turlock needs that cannery."

Lincoln Grange, San Jose, observed the 8th anniversary of its organization recently.

Some of the berry fields near Bakersfield are infested with the strawberry white grub.

Bakersfield and Kern county are discussing the feasability of consolidating the two cities.

Apple growers at Watsonville are now ready to contract to grow your photograph on Bellfleur apples.

Apricots in Santa Clara valley are now promising a fair crop notwithstanding the frost did some damage in lower sections.

The horticultural commission of Kings county is about to take vigorous action in regard to subduing the pest of Johnson grass.

The Kangaroo rat in vineyards about Santa Cruz are still doing much damage and the farmers are studying various plans of reducing the pest.

Apples and prunes in the Santa Clara valley have both dropped heavily within the last two weeks. This will result in material reduction of earlier estimates.

A fruit buyer working in the section of the Santa Clara valley predicts good prices for all shipments of green fruit this year, and fair return for all dried fruit.

The Horticultural Commissioners of Kern county report the presence of black scale for which the rhizobius has been introduced in the hope that it will succeed in eradicating it.

Greater interest is being created in dry farming in the central part of the State than ever before, and it is probable that another season will see great improvement along the line of soil culture.

The Turlock irrigation district is proving to be one of the greatest dairying sections of the State. The creamery at the present time is manufacturing about 750 pounds of butter daily.

The closest examination of the trees near Bakersfield, which were infested with the White Fly last fall, failed to find any living specimens. It is believed that the fumigation was effective in completely wiping out the pest.

Later estimates in the matter of the output of prunes in Santa Clara valley have caused the committee of the Grange of San Jose to report an exceedingly light crop, if not almost complete failure. White cherries will be a fair crop and black cherries very light.

The Bakersfield Echo reports that orange trees in that section on which cottony cushion scale have been discovered, have been dug and burned. This is a strange report, for the cottony cushion scale has such a complete exterminator in the Vedalia that there is never any occasion for destruction of trees.

Southern California

The farmers' institute is being held in San Dimas this week.

The cream condensary of Buena Park is now running overtime.

Rialto orange growers average for their March pool nearly $1.25 per box.

Nurserymen at El Centro have ordered one ton of eucalyptus seed from Australia.

Additional land is to be purchased to enlarge the Date Experimental Station in the Coachella valley.

Next year will see the largest planting of fruit trees, especialy oranges, yet made in the Imperial valley.

Nearly 25 miles of fire break have been constructed in the San Gabriel forest reserve during the past year.

Coachella on the Colorado desert has just shipped to the city of Los Angeles a consignment of rooted rose bushes.

A severe frost visited the fruit sections in the mountains back of Redlands on Saturday, May 2nd, and did much damage.

The recent effort to bind all the cantaloupe associations of the Imperial Valley into one single exchange seems to have failed.

Ventura apricot growers estimate that from the present outlook a much lighter production is indicated than hoped for earlier.

Perris, near Riverside, is having quite a development in the line of pumping plants installed in the form of artesian wells.

A bunch of 28 colonies of bees were stolen from a ranch near Crafton while the owner was enjoying a visit to the battleship fleet.

Forest rangers are now taking their positions in the reserve patrol and during the next six months will be almost constantly in the saddle.

The little town of Thermal is said to be planning to ship large quantities of hay produced by irrigation. Over $40,000 is anticipated as the year's income.

A large portion of land in District No. 8, Imperial Valley, is being reopened and farmed since the completion of the new flume across the river.

The first picking of melons has already been made in Brawley and before this paper is received we presume its first small express shipment will have begun.

Farmers are appealing to the Board of Supervisors of the Imperial valley for water rates on a more reasonable basis than they have been compelled to pay in the past.

An importation of Blastophaga has been made into the Imperial valley from the orchards of Geo. C. Roeding, of Fresno. This is the little insect which fertilizes the fig blossom.

The promise through all Southern California for a magnificent setting of fruit seems to be of the best. It is yet too early, however, to predict as to the orange crop.

The rain storm which passed over much of Southern California on the 2nd of May seems to have been more in the nature of a freak, some sections receiving a precipitation of nearly an inch, while others barely a trace.

The Coast

Utah has 21,397 stands of bees.

Montana ships 40,000,000 pounds of wool annually.

Portland dog fanciers are holding their ninth annual bench show.

Five thousand sheep are being sheared at Ephrata, Washington.

Iron county, Utah, is having a material advancement of the dry farming plan.

Peach trees near Ashland, Oregon, are so heavily loaded that thinning is being done.

The Klackamas county fair association has finally secured fair grounds near Oregon City.

Asparagus and strawberries have been seriously injured by heavy frosts at Eugene, Oregon.

Hemet boasts over $100,000 worth of buildings erected in the town and on the tract since the first of the year.

The State Bee Keepers' Association at Utah recently held a very successful annual convention at Salt Lake City.

Favorable weather conditions in southeastern Oregon during the winter and early spring makes its crop of winter wheat promise a vast yield.

Wheat owners at Volmer, Idaho. have completed their shipments of wheat for the last season, sending out 250 cars within the last 35 days.

The fruit crop at Coeur d'Alene, Idaho, promises to be immense. There is no injury from frost and it is now estimated 200,000 boxes will be the output.

Fruit growers at Brigham, Utah, have formed a marketing association, and have sent an agent East to look after disposing of the fruits of the members.

Two heavy frosts visited the fruit growing sections of Grant's Pass, Oregon, doing great damage. The freeze was so hard that water was frozen hard in hydrants.

Wheat men at Wenatchee, Washington, have formed a pool to dispose of their wheat and materially forced up the price from that which was locally offered before the organization.

A shire colt at Springfield, Oregon, whose mother died immediately after foaling, has been adopted by a Durham cow, and she nurses and guards the colt as if it were her own calf.

Oregon hops are rapidly passing out of the growers' hand and in about two months at the present rate of shipment the State will be cleaned up. There are only about 13,000 bales left in the State.

Fruit growers in Klackamas county, Oregon, have neglected spraying under the directions of the fruit commissioner and he announces that trees will be destroyed unless they are at once disinfected.

A recent meeting of farmers at Sandy, Oregon, took the first steps looking toward the organization of a fruit growers' association for that territory. Their slogan will be "the best apple in the world."

Storms recently damaged much wheat in southern Douglas county, Washington, by blowing sand and covering much of the newly sown grain. This storm is said to be the worst in over 20 years.

THAT FOOL ROOSTER CROWS AT THREE.

That fool rooster is a-crowin',
When I'm sleepiu' jist the best;
Wish there was some way o' showin'
Him t' shet his head an' rest;
There's no need o' him a-yelpin';
Three o'clock's too awful soon!
Wish there was some way o' foolin'
Him t' waken nearer noon.

Jist as I begin a sleepin'
Like the fast mail down the grade,
That fool rooster makes a racket,
Jist the worst that's ever made;
Spoils my dreams, an' makes me cranky,
All the livelong day t' come;
Gittin' waked so awful airly
Makes me feel so awful bum.

There it goes again! I bet you
We will have him in the soup;
Wring his neck? well, now I reckon
I will show him how to whoop!

* * *

That you callin' me, Matilda?
Thought it was that rooster crowed;
"Eight o'clock?"—why don't you call me?
I'd got up, if I had knowed.

By Rev. Gilbert Lard Wilson, Ph. B.

PACKING EGGS.

SHIPPING eggs for hatching and what constitutes a good hatch, are subjects about which we have a great deal of discussion.

In the first place, in shipping eggs for hatching we should give great care in packing them. We all know that express companies either don't or cannot handle them as carefully as they should be. Therefore, it is the duty of every one shipping eggs for hatching to properly pack them that they may reach buyer in good condition. Every oue buying eggs is eager for a good hatch and gives them (as a rule) the best possible care. They pay for the eggs and we should be particular in what is sent.

Only recently we were talking with a man who said that he "had been jobbed;" that his eggs were not properly packed and did not come through in good order, that several were broken and that he only got six chicks out of 15 and he thought "in buying eggs and paying a good price for them that he was entitled to more than six chicks out of a setting."

How Many Chicks.

Now here is room for a discussion and we would like to hear from some of the fanciers who are shippiug eggs for hatching and those buying as to what coustitutes a good hatch and what we should expect from a sitting of eggs. We have bought a good many eggs at different times, and have also sold many for hatching, and never complained as to the hatch we got, although some were good while others were bad. We always figured that if we hatched six chicks that we had done well; of course, we would rather hatch 15 from 15 eggs, but taking everything into consideration we thought, and still think, that six chicks may be considered a reasonable hatch and one that ought to satisfy us. For we should consider that when eggs are shipped that the constant jar of the train or buggy has a tendency to weaken the membrane which holds the egg to shell, thus allowing the white and yolk to mix, although this is so slight we cannot notice it. Yet if the germ for any reason be weak it is sufficient to keep the egg fro

ry new thought takes a year
e age of the brain.

Eggs should be as near a size as possible. Large and small ones placed in the machine at the same time will not give good results.

* * *

An authority says that the embryo chick may not be killed by overheating, but the vitality of the blood is so impaired that the chicks recover very slowly, if at all.

* * *

When an egg containing a live germ is surrounded by a lot of eggs containing dead ones, it is in no condition to get the proper heat, and will have to be a very vigorous germ if it hatches out at all.

* * *

Don't forget in starting the incubator to clean out the heat or flue pipe into which the lamp chimney extends, to put in a brand new wick, to clean all the parts of the lamp thoroughly, having the burners as near as possible as bright as when they were new. Use good sewing machine oil on all bearing parts of the machine, after first carefully removing the dust and dirst.

* * *

I have some White Rock chickens about one month old. They stand around and mope for a few days and die. They keep opening their mouths as if gasping for breath and it looks frothy. About a week ago I found they had head lice and I greased their heads once with lard and coal oil mixed, and powdered their bodies 3 times and now they are free from lice. I feed them chick feed ready mixed from the store. I add a little rolled oats and lettuce at noon and clean water three times a day. Their yard is 6x15 feet for 30 chicks. I spade it up every 3 days and clean out their house every day. I have always had the best of luck with my chickens.—Mrs. J. C., Riverside.

Your birds have a form of roup and they should be treated for the same. I would recommend that you spray their throats well with some good roup medicine according to directions. This disease was perhaps caused by the birds being in weak condition through being troubled with lice. We would also give them a good tonic to tone them up. So long as you allow your chicks to be troubled with lice you are apt to have first one trouble and then another with them. We would clean up the coop and runs and give them a good dusting every week or ten days. This, with plenty of nutritious food, and we think you will have no further trouble.

* * *

White Diarrhea.

I wish to tell you what I have done with my little chicks. White diarrhea in young chicks is what is the trouble and I have read and tried everything possible, but do not find the root of the trouble. I cannot think it is the eggs as my breeding birds have never been ailing in any way. I set the incubators and the hens from the same pens and the hens will hatch 13 out of 14 eggs and raise every chick barring accidents, while the incubator chicks will many of them go with that diarrhea. They are fed the same and have just the same kind of ground to run on. Have Petalumas and Cyphers incubators. Now as to brooder, have hot water and hot air; also have tried putting some of the incubator chicks under hens after they were hatched but the trouble still showed up. I see one person thinks the change in temperature in the incubator from the egg tray to the nursery is one trouble and I have been testing that lately in my Cypher, but the Petaluma is a small one and has no nursery so I do not know what to think. I never breed from a fowl that has ever been sick in any way. If we have a sick bird, and we seldom do, I am glad to say it is at once isolated and either cured or killed very quickly as I do not believe in having them around to spread trou-

West Coast Chick Feed

Don't be induced to take others "just as good." They cost less to make and dealers make more profit on them. You can't afford to feed the little ones anything but pure, wholesome feed, properly balanced to keep them healthy and make them grow. "West Coast" is just this and all pure feed to be fed dry; no filler, no waste, hence really the cheapest. The biggest seller because the best made. For sale by many dealers; if not by yours send direct to us.

WEST COAST MILL
818 San Fernando St. (Through to Alameda) **Los Angeles, Cal.**

Little Chicks should be fed on **Excelsior Chick Food**

prepared from clean, sound grains, seeds, beef scraps and charcoal in proportions to make a well balanced ration and produce strong, healthy chicks and keep them continually growing. For sale by all dealers and grocers. Take no other.

REMOVED SPAVIN—THINKS IT THE BEST BLISTER.

I used Gombault's Caustic Balsam for bone spavin with the best results. The spavin is gone and the mare is sound. I think it is the best blister in the world for bunches of any kind.—H. E. LILLY, Wayne, Kans.

ble, and if cured never go in the breeding pen.

The heavy breed of chick seem to have the most trouble with diarrhea, as I have put Leghorn eggs in incubators so as to test them with the same treatment and they would be troubled very little.—Mrs. E. A. M., Pasadena.

It is hard to tell just where the trouble is, but it is evident that it is in your machine as the same eggs under hens are all right. It may be in the heat, or your machine may need a thorough cleaning. We would disinfect the incubator. Prof. W. B. Graham, poultry expert for the Ontario government at the Guelph Agricultural College, reports spraying incubators with good success. He used genoleum and sprayed all of the interior of the machine including egg tray. The machine was first heated up ready to start, then was sprayed with a ten per cent genoleum.

Again, the trouble may be caused by getting your machine too hot during the last few days of hatch. If heat gets too high and the chicks are brought out too soon it doesn't give them time to absorb the yolk as much as they should.

After your chicks are hatched do not be in a hurry to get them out of incubator, and do not feed them for at least 36 hours after hatched

* * *

Diphtheritic Roup.

I have a yard of chickens that is seriously afflicted with a disease that I can not seem to check. It is unlike anything I ever had before with nearly 10 years' varied experience. The disease begins with a sort of squawking noise as if there was something in the throat. Part of the chickens seem to get choked up like anyone with the asthma, wheezing like. Their throats seem to be swollen more or less. No canker, but have had two that one eye closed, so I took it for one form of roup, which I have been treating them for with a roup cure, but seems to have no effect upon them. They eat and seem to feel pretty well until they are so far along that they begin to wheeze.—Subscriber, Santa Cruz.

In regard to your communication we wish to say that your chicks have diphtheritic roup, as the trouble seems to be in their throat, and you should treat them in the throat. This is the reason you have had no success with the roup cure, as we imagine you treated them in the head. You should get a sprayer and spray their throats well. A mixture of eucalyptus oil, or germazone, would be good.

It might be well for you to make a close inspection of the roosting quarters of these chicks. They are evidently roosting in a draught. Either that, or they are crowding, which overheats them. If this is the case, when the get hot they work their way to the outside and then get cold, which causes them to take cold, which has run into the disease you speak of. But we believe by removing the cause and spraying their throats well with a good medicine and giving them good food to tone them up, that you can get them through all right.

CORONADO TENT CITY OPEN.

To accomodate the crowds during the recent visit of the battleships to San Diego, Manager Hammond, of Coronado Tent City, threw the resort open some weeks before the usual time. It has been decided to keep the resort open and from now until June 10th, a reduction of one-third will be made in rates.

The formal opening of the regular season will occur on June 17th.

A new booklet has been issued, giving full information about rates, accomodations, routes, etc. It also describes the new attractions, chief of which is the new pleasure pier running 700 feet into the ocean and affording fine facilities for fishermen, as well as boats.

Keep the Wheels Turning

One of the little economies that help toward a substantial saving is the use of a good axle grease. A grease without proper "body" runs off. One too heavy stiffens on the axle and adds to the pull.

MICA AXLE GREASE

is *right*—won't run, won't stiffen, won't wear out as soon as other grease will.

Covers the axle with an almost frictionless coating of powdered mica and keeps *your* wheels turning when the other fellow, who uses poor grease, is stuck.

Nothing like Mica Axle
for a tired wagon
the dealer for it.

ne Colt.

e colt can hardly be halter
young. Lead him by the
handle him carefully but
e colt never forgets this
One of last year's fillies
in the pasture; without
g a halter on her, one man
ng her around the neck
other picked up her hind leg and rasped the broken edges. This filly was not frightened by handling like a colt that had never worn a halter, but was helped in her confidence in man as a friend that was able to do things she could not do for herself. When the little colt is first haltered tie him up near his mother for half an hour at a time. Let him wear a light, little halter and handle him by it; rub his back and legs up and down with the hand; fondle and pet him but never tease or pinch him. Nipping and kicking at you may be cunning in a little colt, but like many of the cute things in human babies, it must be promptly surpressed or it will become a vicious trick when they grow older. Then drastic treatment will be needed to make them good.

Training for all Purposes.

At two years old the colt should be bitted and then driven with a good horse. This is continued long enough to have him obedient, say a daily drive of an hour. The feet are not shod but kept rasped to toughen the edges. The horse used with the colts should be a fast walker; these daily lessons should be all walked as fast as possible, never mind trotting or speeding the colt. Walking him fast and keep him walking until he learns to move with head up a good four and half to five miles an hour on the road. Walking is all in the early education and can be taught easily if made the first road lessons. After a month of this work turn the colts out to grow until three to three and half years of age.

The Colt at Work.

As soon as the real work of these colts begin they are comfortably fitted to harness and collars. Now hitch them to the plows and cultivators; teach them to pull resolutely to the end of the rows. There is nothing like plowing to harden a young horse's muscles. The cultivator and harrow add a further useful lesson in picking up the feet and not blundering over trifling things like clods. If the horse stumbles in the soft ground his knees are not marred by scars. This training, not pushing to exhaustion, of the young colt makes him a good traveler, as he does not tire out at the end of a mile or two. The long plow rows give him wind and strength. The livery men are ready to buy at $200 each our less choice horses at seven years old, because they can give their patron a horse that can go miles without fagging out. They stand the road every day in the week as they have had the muscles developed to do this work easily.

Sulky Work.

Take the horse broken for speed in a sulky he is meant for different work and receives his training, yet if we farmers wish a horse to work, a man thinks he must break our horses in the same way. At present seven three-year-olds are being put to work here on the ranch. They are purchased animals and are being worked for the first time. The large farm wagon is being used for their "sulky." Take the ordinary horse broken in a light cart and put into carriage work at once, now when he comes to a stretch of deep mud or heavy sand he is all in. Take a driving horse and try him by driving down the rows of the orchard; if he will pull the buggy along then buy him, but do not fail to try him in this way. A well broken

Tubular Separators
Are All Built Exactly Alike. The Best that Knowledge and Experience Can Build Alone Goes Out of This Factory. We Make No "Seconds."

When you purchase a **Tubular Separator** you buy not only the best separator that is built, but also exactly the same separator that every other Tubular purchaser gets.

There are no different grades of Tubulars built. The best that can be built is what the dairyman needs, and it's what he gets who buys a Tubular. Some "bucket bowl" manufacturers advertise and advocate two or three different qualities of separators, firsts, seconds, thirds, etc. They are bound to get a man's money if he has any. They don't furnish even their own best always, but try never to miss a customer. If the present-day sale is made these hucksters of different grades don't care for the dairy service of the future.

The Tubular looks to the future interests and profits of customers. Every buyer of a Tubular gets not only the best separator that the world knows, but he gets the kind he pays for, and it is exactly the same separator that every other purchaser gets.

There is only one grade of Tubular—the suspended bowl, bottom feed, enclosed gear, self-oiling, low-down supply tank, cleanest skimming machine. Each is perfectly built, all are alike, all are guaranteed the same.

You're always safe when you buy a Tubular. If several grades were made you would not be safe, and might have a mistake to pay for. Be safe and get the best at the start; the best is not too good for any dairyman—the best is always the cheapest. Write for catalog No. 260.

carriage animal should pull, if necessary, until the traces break rather than balk. Willingness in a horse is of more value to the ordinary driver than a pedigree.—M. E. Sherman.

BREEDS OF HOGS.

What is the best breed of hogs? We always answer, the breed that you like best. A good individual, well bred and from a prolific strain of any popular breed of hogs will make money if handled right.

The Poland-China is a nearly perfect machine for converting feed into pork. It is an easy keeper, a quick fattener, and when handled properly is ready for the market whenever the price is right at any time after it is five months old.

The chief objection to the Poland-China is that many strains are not prolific, the sows having only one to four pigs at a litter. This has been largely caused by over-feeding with corn in the corn belt.

Where the sows have been properly fed on nitrogenous feeds and prolific ones only kept for breeding the Poland-China is as prolific as any breed.

The Berkshire is a prolific breed, adapted to any condition favorable for hog raising. It will fatten at almost any age, and by feeding can be developed either into a lard or a bacon hog. It is an active hog, a good grazier and will take care of itself in the feed lot with cattle. It takes a better fence to hold the Berkshire than it does some of the lazier breeds.

The Duroc-Jersey as now bred differs but little from the Poland-China except that it is red in color and is more prolific. Records collected from thousands of sows of each breed by the U. S. Department of Agriculture show that the Duroc-Jersey sow averages a larger litter than the Poland-China sow. The hogs of this breed mature quickly, are good feeders and prolific.

The Tamworth is a bacon hog with long, deep, thin body, long nose and long legs. It looks like a "razor back," but will put on as much weight in a given time from an equal amount of feed as a hog of any of the other three breeds. The meat has a large proportion of lean and is well marbled. The Tamworth is a profitable hog if pushed from birth until marketed, but if once stunted it will never recover and make a profitable feeder. —H. M. Cottrell, Superintendent Farmers' Institutes, Colorado.

OVERFEEDING CAUSES INDIGESTION.

One of the most insidious foes to good health in hogs is constipation. It is the begining point of a great many other serious ailments that affect hogs. It is easier to prevent disease than it is to cure it. By preventing disease the hog can gain continuously, but after disease attacks the hog it loses and the profit in hog raising is lost with it. It is not the feed which is eaten, but it is that which is digested properly and assimilated by the animal that brings about good results. The hog that is clogged up soon becomes surfeited with feed and loses his appetite or desire for eating. To make a success of feeding, hogs must have appetite and anxiety to eat. Therefore, it is vital that they be kept in a condition for demanding feed. But do not overfeed; it is better that they should be a little underfed than over-supplied with feed. Each meal given should always be eaten up clean, and the trough

should be thoroughly cleansed after feeding. Never throw fresh feed into the trough if it contains any of the old or sour feed in it. In this way you will keep the appetite toned up and a good appetite causes a good flow of salvia and naturally assists good indigestion. A voracious appetite which is unnatural accompanies indigestion. The hog remains hungry after he has filed up on all that he can eat, and is worse off than if he had not eaten at all, as he has only added to the burden of organs which are overworked already.

CHARCOAL FOR HOGS.

A swine grower asks if it will be necessary to buy coal or charcoal if wood ashes and salt are fed pigs.

Charcoal does two things: Supplies some mineral matter and keeps the digestive system clean and toned up. If a sufficient amount of hardwood ashes be fed to pigs there will be no need of buying charcoal. Some people buy the bituminous coal and feed it, but it is just as well to buy fine charcoal, which can be purchased very cheaply. The very cheapest way to get charcoal is to dig a pit, fill it with corn cobs, after starting a fire, and then cover it over with sheet iron and earth. Leave for a time, when it may be uncovered, the fire put out and a nice lot of charcoal will be found. This will answer just as well as that which is bought.

Salt should be supplied hogs always, and particularly if clover hay, barley, corn or bran are fed, since these feeds contain more or less elements such as potassium, which drains the system of chlorine. Chlorine is absolutely necessary in the production of the hydrochloric acid used in digestion. Hence to make digestion normal, salt, which is made up of sodium and chlorine, is necessary. It is best to supply salt so that hogs may have it at will, either in a salt box or with the charcoal or ashes.

Ashes from hardwood are valuable to hogs in supplying an alkaline lye, which is detrimental to worms or other parasites in the digestive system.

It will be seen then that the ashes, if they contain some charcoal and the pure ash and salt, will answer the need of your pigs without further purchase of charcoal or coal.—Farm, Stock and Home.

HOG NOTES.

Take care also to have the bedding dry. Nothing is worse than dampness for hogs.

Keep awake to your possibilities, and you will be pleased with hog growing as a business.

Be sure to give the hogs a chance to exercise every day. This keeps the digestive apparatus working well, and keeps the hogs healthy.

If you have any young pigs, keep them constantly on the gain, but don't stuff them too much. If overcrowded at the beginning they don't do so well in the end.

Get acquainted with your hogs these days. See which ones are the easy keepers, and which ones "eat their heads off" and then don't amount to anything.

Remember that an ounce of prevention is always worth a pound of cure, and try to keep all the conditions ideal for your hogs. Keep your eyes open so that you'll notice the first indication or symptom of disease. Then seek to overcome the cause before the case becomes aggravated.

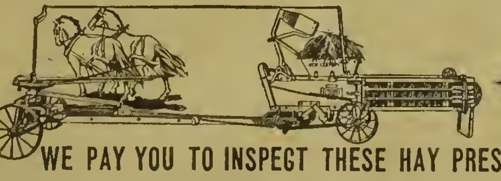
FREE TRIP TO SEE THIS HAY PRESS AT WORK



LOS ANGELES AND RETURN AT OUR EXPENSE

WE PAY YOU TO INSPECT THESE HAY PRESSES.

Instead of paying a salesman's fare to show you a small model of a hay press, we will pay your fare to Los Angeles and return, not exceeding $15.00, to examine our California Special New Century, full circle, all steel, self feed Hay Press and all others on sale there. It makes no difference which hay press you buy, we pay your railroad fare just the same.

When you see for yourself how this machine has been built expressly for heavy baling on the coast, how strong it is, how easy it is on horses, what smooth bales it turns out, you will understand why we make such an offer. It has 7-in step-over, pull power, high baling chamber, positive plunger rebound; it stands up to its work, no taking off of wheels. Has record of 39 tons per day. We will ship you one to try. If you don't want it we will pay freight both ways. Write now.

Planting Peach Trees.

Is it injurious, or does it hinder the growth of young peach trees to have the budded stump under the ground? Or should it be above the soil at all times?—F. E. P., Porterville.

As a rule, deciduous trees are set so as to bring the bud under the surface of the ground. With citrus trees this is considered objectionable in view of the latest information on gum disease, but we have never heard of ill results to the deciduous tree.

Loquats and Blue Gums.

Please give information regarding growing of loquats and blue gums.. That is, raising them from the seed.—R. M. P., Riverside.

The growing of blue gums is very simple, usually being propagated by planting seed in August which brings the trees in good size for the following spring field planting. The ground should be partially protected from direct rays of the sun and seed kept moist and given usual care for such seed. They may be potted or put in cans later so as to establish the roots ready for the planting in April or May.

The loquats may be reproduced from the seed, but the seedling is not liable to have all the good qualities of the parent. On this account the budding or grafting is necessary in order to be sure of desirable variety. The Advance, Premier or Victor are any of them good varieties.

White Rabbits.

A pair of white rabbits have given me two litters which they have failed to raise. The last time I had them separated putting the male in the run next to the female. After the little ones were a few days old she ate them. She had plenty of green food and rolled barley.—New Subscriber, Chino.

We have presented this matter to people who have had experience with Belgian hares, but never like this. The male should not have been left with the female at first, and we think it would be better if he were removed entirely from the female as soon as nesting is indicated. Besides, it is well for the nest to be protected from observation where the mother will feel confident the little ones will not be disturbed. If any subscribers of the Cultivator can add any other points it will be appreciated.

Rolling Down Onions.

Will you kindly inform me through the Cultivator as to whether it is a common practice with onion growers to roll down the onion tops, and do you consider it beneficial? Also at what stage of the growth of the onion is this done?—C. E. S., Chino.

Many gardeners practice rolling the onion beds, claiming there will be fewer scallions. I have never been able to se that it made any difference. If an onion shows indications of developing into a scallion or "thick-neck" no amount of breaking down the top will cause it to develop into a well shaped bulb, and I would consider it labor thrown away to roll a bed with that end in view. It is usually done just about the time the crop seems to have attained its full growth. Some growers wait until the tops begin to turn brown or ripen.—Q. A. L.

Veterinary

Dr. R. T. Whittlesey, veterinarian, of 714 East Seventh street, Los Angeles, will answer questions in this department. In writing of sickness or injury to any animal be explicit in giving symptoms and particulars. Always enclose full name and address, but if assumed name or initials are preferred they will be used.

If an immediate mail reply is wished enclose $1.00 for such service, but for replies in paper only, no charge is made if the answer will be of general interest.

Weak Legs.

Will you tell me through the Cultivator what is the matter with my pigs. They commence to fall down in hind parts at six weeks old. Later tip over on their ankles and drag their hind legs after them. Are fat, likely, and have good appetites. They gradually get worse. These come of healthy stock for generations back and mothers fed on skim milk and corn. Veterinarian prescribed sulphate of iron and we have tried home remedies all of which did no good.—Old Subscriber, San Jacinto.

From your description I think they have richets, which comes from lack of bone making material or mal-nutrition where it is not taken up by the system. They should have calcium phosphate in one drachm dose twice daily.

If you make a solution of one ounce of calcium phosphate to eight ounces of water each ounce of the solution will contain the proper sized dose.

Veterinary Law.

Will you please tell me what the law of this State is in regard to the practice of veterinary medicine, or inform me where I can get such knowledge.—F. B. S., Sanger.

It is illegal to practice without a license from the State Veterinary Medical Board. To procure this a man must be a graduate from a recognized college and besides must pass an examination before this board.

Dr. W. B. Rowland, Pasadena, or Dr. W. E. D. Morrison, Los Angeles; either can give you further information.

Injured Feet.

Have a fine five-year-old 1500-pound mare with a young colt. One morning an iron rake very much bent was found under her feet, presently she began to walk lame. About that time she was shut up in the stable for short periods, with colt in yard. She made a good deal of noise pawing sides of stable and floor. I find no fever in foot or anything to locate any injury of shoulder. No better in three weeks.—A. A. H., Exeter.

Have been in constant practice for

WANTED—MALE HELP.

MEN TO LEARN A TRADE IN FEW months by actual work in shops and on buildings—no toys or books. Plumbing, electricity, bricklaying, etc. Organization of contractors employ graduates. Free picture catalogue. UNION SCHOOL OF TRADES 120 to 126 E. 9, Los Angeles, Cal.

SITUATION WANTED.

WANTED—A WELL RECOMMENDED MAN capable of taking charge of a dairy farm or ranch; would like to find the right place for a good man, unmarried and will go to any point in California or Arizona. Address A. B. C., care Cultivator office, Los Angeles.

A NEW ORDER.

Mrs. Bildad looked up over the evening paper which Mr. Bildad had thrown aside and asked;

"I believe you are an "Eagle," are you not?"

"I am," proudly remarked Bildad.

"And an Elk?"

"That's right—I am."

"Well, Im thinking about organizing another society with a name something like them."

"What are you going to call it?" queried Mr. Bildad.

"I think I'll call them 'Homing Pigeons,'" replied Mrs. Bildad, "and I want you to be a charter member. I suppose you have to go back to the office this evening?"

But by this time Mr. Bildad was in the hall, reaching for his hat and coat and muttering to himself.

Western Gas Generators

The most reliable and cheapest GASOLINE GAS GENERATOR ever put on the market.

For Lighting, Cooking and Heating. This Generator is used by the largest hatcheries in California for Incubating and Brooding.

AUTOMATIC, SAFE, ECONOMICAL.

Read what Mr. A. W. Foster, President of the California Northwestern Railway, has to say about them:

Gentlemen: Replying to yours of the 20th inst., I would state that the plant installed for me by the Western Gas and Power Company on my Hopland Stock Farm, is giving entire satisfaction, and I cannot speak too highly of it. Yours truly,
A. W. FOSTER.

Mr. Foster used an acetylene gas generator before we installed our Western. Send for our latest Booklet.

Good reliable Agents wanted.

Western Gas & Power Co.

1842-48 Seventh St., Oakland, Cal.

$16.30 buys this handsome six-hole Nickle-Trimmed Cast Range direct from the Manufacturer

without high shelf. With high shelf, just as shown in the cut, $19.97; large oven, six cooking holes, best quality of iron. Burns coal or wood. Handsome nickel trimmings. OUR TERMS are the most liberal ever made. You can pay after you receive the range. You can take it into your own home and use it 30 days. If you don't find it exactly as represented, the biggest bargain you ever saw, you won't have to keep it.

AFTERWHILE.

Afterwhile—and one intends
To be gentler to his friends—
To walk with them in the hush
Of still evenings, o'er the plush
Of home-leading fields, and stand
Long at parting, hand in hand:
One, in time, will joy to take
New resolves for some one's sake,
And wear then the look that lies
Clear and pure in other eyes—
He will soothe and reconcile
His own conscience—afterwhile.
—James Whitcomb Riley.

THE SCAPEGOATS.

"IT is false," he said, with slow anger. She stiffened and looked coldly into his eyes.

"It is a--lie," he insisted, more quietly, but more emphatically, folding his arms across his chest. "Stella, are you going to accept a comparative stranger's word against mine? It's monstrous—perfectly abominable."

"I saw you—drop the knave of trumps into your lap when Mr. Manton led the seven," she said in a whisper deliberately. "And the knave of trumps was in Bob's hand."

"And the knave of trumps was in your brother's hand?" he said after a moment's pause.

"Oh," she cried, springing up, "you mean your tone to imply that Bob might have been cheating, as he was your partner? How mean—how contemptibly mean! You would like to make him carry the load of your shame for you! A boy of nineteen—a Carlton! There never was a Carlton who would cheat at cards!"

"Nor a Riversley," he answered, coldly.

"I am sorry that I should have been affianced to the Riversley who broke the line of honest gentlemen of that name," she retorted, hotly.

"That is unworthy of you," he said, gravely. "I think I had better go."

"Yes," she said, between her teeth, tearing at her finger rings, "you had better go." She held one out to him and a look of faintness stole over her proud face.

He took a step toward her and she reached toward him and dropped the ring into his hand.

"Thank you," he murmured. "I—He checked himself, turned and left her.

II.

"I knew you were cheating and that Wallance and Manton realized something was wrong; and I was sure you'd play the knave on the trick and my knave would expose your dealing. You must tell her, Carlton! It's impossible I should go about branded as a card cheat!"

"I cant tell her!" cried the boy, stamping his foot impatiently. "You don't know what it would mean Stella is as proud as Lucifer, and—I don't know what she'd do. She'd tell dad for one thing, that's certain; and—oh, Riversley, old chap, you don't know what it would mean or you'd never ask me to do it."

"Well, I've told you how I stand," said Riversley, rising and walking over to the mantlepiece. "She believes I was cheating and—she's chucked me; just as any girl would do, believing it. I don't blame her for that; what I blame her for is believing me capable of such a thing."

"I can't do it! Good heavens! you must be mad to think I could go to her, and—it's impossible! I'm sorrier than I can possibly say, Riversley. I would have done anything in the world rather than it should have fallen on you."

"No more words about got to put it right. Within four hours I shall expect from Stella that she knows still a gentleman."

III.

On the balcony of a little ho looking the Bay of Naples sat ley in an armchair. The comfortable to a luxuri yet he moved constantly uncomfortable. He was a paragraph that he had an hour before in the M which he regularly receive

"A marriage has been ar tween Miss Mary Vincent ton, only daughter of Gr ton, Esq., of Hadley Park 341 Hill street, W., and Brundon Rouston of Rous

The announcement ha him as a surprise, for the no hint of such a thing the letters he had had f Carlton during the last Otherwise, of course, it prising. Houston was fellow, a handsome man est gentleman. No, other not surprising.

Riversley moved uneas chair and the paper slippe knees. He let it lie. The matically picked up the P which had arrived with hi Post and tore it open. S started. Bobby Carlton w Stella and her father were The boy had been hurled motor car he was driving. few hours later in the Par

Had he spoken?

Riversley rose weakly chair and hurried from th Forty hours later he was Immediately on his arrival at the hotel at which the said the Carltons were stay

Mr. Carlton was not wit hesitating, Riversley wrote words on a card and sent Stella. She came to him i ing room, and he knew w ing heart that the boy had

"I have read of the ac your brother, Miss Carlton. Naples," he said. "I—may he left any message—er—

"No; not that I am awa answered, folding her ha her. "He is not dead, you reports were wrong in lar."

"Not? Oh, I am might

"But there is no hope— ever. Father is with him pital now."

"I—I am awfully sorry!" Riversley, glancing at his h I don't know whether it will fitting request to make, but it be possible if he is cons me to see him for a few a matter of the utmost impor myself? She hesitated ed: "I may say it is a more than life and death to

"If you will wait while I put hat I will come with you to the pital and see," she said.

"Thank you," he replied, glancing at her with bright eyes.

"We will walk—it is near," said, when she reappeared.

"Do you wish to see him al she said, as they reached the pital.

"No; oh, no."

PERSONAL NEATNESS.

Just now it's the mumps. Our children have it—or them—whichever is correct. But the mumps are "easy" and give the youngsters a good excuse to stay out of school. But there are others not so easy, which are sometimes serious. The following from M. A. Y. is full of good suggestions:

Not Too Young to Learn.

When the little ones are old enough to start to school, they should be taught to guard against infection, as much contagion is carried by school children, simply because they have not been taught the danger of it, or how to avoid it. They should be taught to never wash their face and hands in the same basin with the other children at school, as many have serious eye trouble, and by using the towel that these children use, the granulated lids and other diseases of the eye can be transmitted, as they are very infectious. The same is true in the use of handkerchiefs, and each child should be provided with one of its own, so there will be no occasion for borrowing another, and if one child has a bad cold or sore eyes, their handkerchiefs should be washed separately and not with the other children's. Wash them separately in hot suds which has had a teaspoonful of borax dissolved in it, then rinse thoroughly in two waters with a little borax in each, as the borax not only softens the water but purifies and disinfects, and there will be no danger of disease germs when they are washed in this way. It is remarkable how soon the children learn the danger of contracting diseases, and they soon learn to be very careful along this line, if they are only warned and talked to earnestly by their mother. As disease germs can be carried under the finger nails, a good plan is to have the children wash their hands thoroughly every night before retiring, using a nail brush, and soaking the nails for some time, then after their hands are washed and dried have them push back the skin at the base of the nail with a soft, dry towel, as this treatment will discourage hang nails and greatly improve the shape of the finger nails. It is wise to observe such little practices, for infectious diseases are numerous, and when once you get them it takes years sometimes to eradicate them.—M. A. Y.

HOMELY HINTS.

If you scorch an article badly when ironing, moisten it with lemon juice, rub in some salt and lay it in the sunshine. If it is only a slight scorch the sunshine alone will remove it.

Burns and Scalds.

To relieve pain, put on common baking soda, after first putting the injured part into tepid water. Then cover with cotton wadding. Carbolated vaseline—ten drops acid to one ounce vaseline—is a good dressing spread upon cheesecloth. If the burned places swell badly, apply fomentations to stimulate the circulation. In very severe cases where much skin has been destroyed, the burned parts can be kept immersed in water until new skin is formed, changing the water once or twice a day. In the hospital in Vienna, I saw a man who had lived in a continuous water bath for nearly a year, as treatment for very extensive burns. He was nearly well enough to be restored to a drier mode of life.

Use A
NEW PERFECTION
Wick Blue Flame Oil Cook-Stove
Because it's clean.
Because it's economical.
Because it saves time.
Because it gives best cooking results.

Hay.

Somers & Co. say:

Arrivals of hay have been rather light during the past week, the total showing 2340 ton, about the same quantity noted for the week preceeding. The market has been alternately strong and weak according to the number of buyers on hand each day. As we write, the situation is not particularly active, although the choicer grades of wheat, tame oat and wild oat hay for retail purposes are in good demand. Because of the comparative scarcity of the choicer varieties there is a wide range of prices and although the extreme prices obtained might indicate a much better market than was experienced a week or two ago, yet on the whole, the situation is practically unchanged with occasional fancy cars only selling at advanced figures.

Crop conditions seem to be the all-important topic of the day and although considerable excitement is felt in some localities yet with our recent showers and favorable cool weather we have no apprehension as to the outcome of the situation. We believe that both the hay crop and the barley crop will be sufficient for all our needs and that prices on both will rule at a moderate range so that no hardships will be imposed on either the grower or the consumer.

Choice wheat hay	1.70@2.00
Good wheat hay	14.00 to 16.00

QUERIES.

Continued from Page 563

twenty-five years and often find it very difficult to locate obscure lameness with the animal before me. And it is absolutely impossible to locate the above from the meager description at hand.

Inflamed Udder.

My cow dropped a calf recently. Have been unable to get any milk, the cow's bag being swollen and inflamed. —A Subscriber, Pasadena.

This is a case for a good veterinary, of which you have several. The udder should be inflated with sterilized air to dilate the milk ducts or tubes and force back the blood supply in that way reducing the congestion and fever. This is no case for delay, and by the time you read this it may be too late.

Lumpy Jaw.

Can you give symptoms of lumpy jaw in cattle and what other ailments are similar, and describe difference, cause and cure? Does the barb or sticker grass, or, as some call it, fox tail, ever work down the throat of cattle?—Jones, Santa Cruz.

The only absolute sure diagnosis of lumpy jaw or actinomycosis is by the aid of the microscope. Cut open the tumor, cut out a piece the size of a walnut, put in a large mouthed bottle in a solution of formaline and water 1 to 100. Send to Veterinary Department University of California, Berkeley. They will make a free examination. A cow may have simple abscesses not containing the ray fungi. I have opened hundreds and never found any fox tail as yet, if that is what you mean by "working down the throat."

Treatment for lumpy jaw was given a few weeks ago, and is as follows:

One pound of potassium iodide in sufficient water to make one quart. This makes 32 ounces of the solution and the dose is one-half ounce night and morning; give in any way that is most convenient. This is usually sufficient to produce a cure, but sometimes must be repeated. It is good to skip the treatment about every seventh day.

Stoppage of Teat.

Last year one of my cow's teats got a thorn in it. The milker pulled it out and the cow not liking to have it milked, it soon dried up. It has a large lump in the middle. She is now fresh again and that quarter seems to have milk in it. Do you advise me to open it up; if so, how? A neighbor has a bistoury.

You had best call in a good veterinarian, but if it is not possible, make a hole through the lump first with a trocar, follow with the bistoury. Introduce a self-retaining milk tube and keep it in all the time; cork it up except at regular milking time, when the tube should be moved to keep the stricture from adhering too tight. Tie a sack over the udder to keep the tube from being pulled out and so you will not loose it if it comes out.

MAN'S FOOD ASSURED.

One of the greatest problems which has in late years occupied the attention of scientists has been solved by the discovery of new deposits of nitrate of soda. "How can the exhausted fields and farms of the world be replenished with the nitrogen which alone can produce food for the race?" was the question. The finding of the new deposits in Chile, covering a vast area, is the answer.

Nitrate of soda is not as visibly connected with the welfare of the race as sunshine, but it is almost as important an element in the development of the individual and the perpetuation of the race.

Some specialists have said that the Chilian beds, as heretofore known, would be exhausted in fifty years, and that the era of decreasing crops would then begin, with terrible consequences to the race. As a matter of fact, new nitrate of soda deposits have been discovered continuously for many years, so that there has actually never been a time when the American farmer's supply of nitrate was in danger of failing. The new discoveries, however, place the certainty and immensity of his supply beyond all question. He can now secure unlimited quantities of this most effective and most easily applied of all fertilizers at a more advantageous price than ever before. In fact, overproduction is in sight unless new uses are found for nitrate.

From the best information obtainable the nitrate mines are good for 200 or 300 years, even at double the present rate of production, which is about 2,000,000 tons per year.

Nitrate of soda is the world's leading fertilizer and it is gratifying to note that the American farmer may now secure unmeasured supplies of his best fertilizer—contrary to the general rule—at rates cheaper than ever before.

Water Pipe Cheap

25 CAR LOADS NOW BEING UNLOADED

250,000 feet of this shipment is second-hand pipe, practically as good as new, and is now on sale at a big discount by the Adams Pipe Works, 2025 Bay street. Sizes and prices: ¼ inch 1½ cents per foot; 3-8 inch, 2 cents per foot; ½ inch, 2½ cents per foot; ¾ inch 3½ cents per foot; 1 inch, 4¾ cents per foot; 1¼ inch, 6 cents per foot; 1½ inch, 7 cents per foot; 2 inch, 9¾ cents per foot; 2½ inch, 15 cents per foot; 3 inch, 18 cents per foot; 3½ inch, 20 cents per foot; 4 inch, 32 cents per foot.

Oil well casing prices and sizes: 2 inch, 7 cents per foot; 2½ inch, 9 cents per foot; 3 inch, 13½ cents per foot; 3¼ inch, 15 cents per foot; 3½ inch, 17 cents per foot; 4 inch, 18 cents per foot. All pipe is carefully inspected, new coupling and new thread are put on every piece, every joint is guaranteed to be first-class, serviceable pipe. This pipe is sold in any amount; small orders are given the same attention as large ones. Mail orders promptly filled. To reach the Adams Pipe Works, take car marked Pacific Boulevard, starting east on 7th St. from Broadway. All lines will transfer to East 7th St. new line. Ask conductor to let you off at Bay St., and go east half-block. Phones, A1917, Broadway 1264.

nserving the Resources of Nature

ıave become great because of the lavish use of our re-
rces and we have just reason to be proud of our growth.
t the time has come to inquire seriously what will hap-
our forests are gone, when the coal, the iron, the oil and
e exhausted, when the soils shall have been still further
ıed and washed into the streams, polluting the rivers,
the fields and obstructing navigation. These questions
ıte only to the next century or to the next generation. It
us now as a nation to exercise the same reasonable fore-
lealing with our great natural resources that would be
any prudent man in conserving and wisely using the
which contains the assurance of well-being for himself
ildren.

ıatural resources I enumerated can be divided into two
istinguished classes accordingly as they are or are not
f renewal. Mines if used must necessarily be exhausted.
rals do not and can not renew themselves. Therefore, in
ith the coal, the oil, the gas, the iron, the metals gener-
hat we can do is to try to see that they are wisely used.
ustion is certain to come in time.

The second class of resources consists of those which can not only be used in a manner as to leave them undiminished for our children, but can actually be improved by wise use. The soil, the forests, the waterways come in this category. In dealing with mineral resources, man is able to improve on nature only by putting the resources to a beneficial use which in the end exhausts them; but in dealing with the soil and its products man can improve on nature by compelling the resources to renew and even reconstruct themselves in such a manner as to serve increasingly beneficial uses—while the living waters can be so controlled as to multiply their benefits.

Neither the primitive man nor the pioneer was aware of any duty to posterity in dealing with the renewable resources. When the American settler felled the forests, he felt that there was plenty of forest left for the sons who came after him. When he exhausted the soil of his farm he felt that his son could go West and take up another. So it was with his immediate successors. When the soil wash from the farmer's fields choked the neighboring river he thought only of using the railway rather than boats for moving his produce and supplies.—Theodore Roosevelt before Governors' Congress.

COULSON'S

CRESOLENE

Lice Killer Disinfectant and Dip

❋

Dilute With Water Before Using

❋

CRESOLENE is a powerful disinfectant, insecticide and germicide obtained from coal tar. It is non-poisonous, and non-corrosive and will do no harm to the most delicate skin.

It mixes readily with water, forming a milky emulsion, and can, therefore, be diluted from 50 to 100 times its own bulk, in accordance with the different uses to which it is put.

Thus when you purchase 1 gallon of CRESOLENE you can make up to 100 gallons of the best disinfectant at a cost of only 11-4 cents per gallon. Write us for particulars and guarantee.

e Present Status of Parasitism

Address by S. A. Pease, Horticultural Commissioner of San Bernardino County, at the State Horticultural Convention at Riverside, April 29, 1908

e present status of parasitism I mean of
value are the different parasites, local
introduced, as proven by their efficiency
efficiency in the orchard or elsewhere

ia has had a lively interest in parasites
sect pests ever since the introduction of
ia cardinalis, parasite for the white scale,
rchasi, in 1888. At the time of its intro-
he white scale threatened the citrus in-
California. Thousands of dollars had
nt in mechanical methods endeavoring
the pest, but with very poor results.
lia proved master of the situation and
months from the time of its introduc-
practically cleared the field and given
ardists renewed courage. Later, an-
rasite, Novious koeblii, was liberated
rchards and proved a good second for
lia.
hat time growers have hoped that equal-
arasites would be discovered and brought
tate to combat all of our insect foes.
pes have been crowned with varying de-
success and failure.

Scale.

ly the San Jose scale, Aspidiotus per-
. was next in importance to the white
its presence and injury was so wide-
nd and so fatal to the deciduous fruit in-
many localities. Great expense was in-
n combatting this scale with salt, limc
hur, kerosene emulsion and other rem-
a good many years. Persistent efforts
de to find the natural enemy of this scale
effort was finally crowned with success.
Jose scale is now in a satisfactory state
ction by parasites—the Aphelinus fusci-
hizobius lopantha, Chilicorus bivulnerus
ers.

Tehachepi, but north of that has been a
pest. It is, however, now controlled by
asite, Comys fusca, which, like the parasite
San Jose scale, lays its eggs beneath the
These eggs hatch in the proper season
rvae which eats out the scale inside of its
r house; pupates there and later the per-
y emerges through a hole which it makes
outer covering of the scale.

The soft brown scale, Coccus hesperidum, is also kept in perfect check by its natural enemies—Chalcid flies and others.

Aspidiotus hederse, A., cameliae-rapax, which are common feeders upon oleander, English ivy, umbrella privet, pittisporum and other plants, and which are sometimes found on the orange and lemon fruit, and then called lemon peel scale, are quite well controlled by chalcid flies, Rhizobids and Chilicorus bivulnerus.

For the Black Scale.

Since 1893 we have had periodical reports that a parasite had been introduced that would keep in perfect check that widespread pest and life destroyer of fruit and other trees—the black scale—Saisettia oleae. It was about this time that Rhizobius ventralis and R. deblis and toowoombae or lopantha were acquired. These, with the aid of Tomocera californica and Chrysopa californica, did some splendid work along the Coast. Indeed, they made such a good showing that orchardists in the interior had great hopes that they would control the scale everywhere. Hundreds of thousands of them were colonized in every section of the southern orchards; but after repeated trials and after waiting for a number of years for them to be acclimated to our dryer and hotter interior climate, we were forced to give them up and again resort to fumigation and spraying to relieve the orchards.

In October of 1901 our hopes were again raised by the report that a new parasite had been discovered in South Africa, and that a lot of oleander cuttings were on the way to our State Commission. The cuttings arrived and the little fly, the Scutellista cyanea, was bred out, and after a little time colonies were liberated in Los Angeles county and later were distributed from there over all Southern California. They increased so rapidly that it was commonly thought that we had the right enemy for the black scale and that the pest was doomed.

In two years' time I saw in our own county orchards in which at least sixty of the black scale were parasetized in the month of August and I, with the rest, thought that our troubles with the black scale were at an end. The following April I looked for a colony, but could not find any of them. The same results had to be recorded for May. In June I could find a very few, as also in July. In the latter part of August they were very numerous again, but I looked farther this time and I found that while in some instances 60 per cent of the old scale were parasitized, still from 75 to 90 per cent of the young scale had hatched and were out on the leaves and limbs of the trees.

After close study of the situation for a year or two, I arrived at this conclusion: The Scutellista is an egg eater only, and as the black scale in the interior counties is practically all hatched out by the first of September of each year and do not commence laying eggs again until near the first of May, that the Scutellista starve out between September 1st and May 1st. I have, however, seen some good work done by the Scutellista along the Coast. In Ventura and Santa Barbara counties, within one or two miles of the ocean, the olive trees are the cleanest that I have seen and this result is accomplished by the Scutellista; but on one place I saw that the olive trees were clean, while just across a driveway the lemons were quite badly affected with the black scale. This desirable condition along the Coast may be, I think, attributed to the fact that the black scale has in some places more than one brood a year and that Lecanium hemisphericum, which is very plentiful there, breeds in the same way, and thus more of the Scutellista are carried over the winter and are ready to work on the first eggs laid by either the black or hemispherical scales in the spring.

At the present time the State Commission is trying to establish a body parasite for this pest and we continue to hope that the efforts in this line will finally be rewarded with success.

Yellow Scale.

The yellow scale, Chrysomphalus aurantii citrinus, was first known as the San Gabriel red scale, on account of its lighter shade of color. In fact, until very recently it was considered by the Department of Agriculture as a variation of the red scale. Its habits, however, are different, as the red scale infects the leaf, limb and fruit, but the yellow is seldom seen on the limb, but only on the leaf and fruit. For years this scale has been credited with having a parasite that would check it to the extent that it would no longer injure the orchards.

Individually I have had occasion to look up this scale very closely. It was introduced into a part of our county not infested with any other scale so that it could not be confounded with others. It was reported to the State Board, and Alexander Craw, with the State Commission, determined the species and sent colonies of Aspidiophagus citrinus, the supposed parasite. These were reinforced many times, and after thorough inspection I can say I never saw one-tenth of one per cent. of the scale that were parasitized, and I so reported to the State Commission. I was told that it was very queer, when they did so well elsewhere. Later I had opportunity to observe this scale elsewhere, and I found the scale very bad everywhere that artificial means were not taken to control it.

I once had several hundred leaves sent me from Los Angeles county so that I might breed out the parasites. These leaves were thickly covered on both sides with the scale (not a good indication of parasitic work) and I put them into breeding jars and cared for them for a month, but not a single parasite did I get.

During a trip to the northern part of this State I looked up the parasite there, and found very little, if any, evidence of their work, but there was plenty of yellow scale everywhere. I found them on the capitol grounds at Sacramento and on trees at Marysville, Yuba City and Oroville. So, I was forced to the conclusion that the Aspidiophagus citrinus was not to be relied on. The reputed parasite is a golden chalcid fly, whose method is like that of the Scutellista, i. e., wherever it works you will find the small round hole in the scale where it makes its exit.

For the Red Scale.

Somewhere about the year 1891 or 1892 Albert Koeble, who had been sent abroad by the State Board of Horticulture, sent among other parasites a steel blue ladybird—Orchus chalybeus—to prey upon the red scale, and these ladybirds were liberated in the Kerchoff orchard in Los Angeles; but after much time the decision was arrived at that they were not equal to the task. They are still to be seen occasionally in the Coast counties but not in sufficient numbers to do much good.

I have known the golden chalcid fly to eat a few red scale, but not enough to be entitled to the name of parasite, as they do not make any appreciable showing against the scale.

Present Status of Parasitism

Continued from page 571.

Purple Scale.

For a number of years we have been told that one of the Rhizobids was preying upon the purple scale, Lepidosaphu beckii, viz., R. lopantha, but I venture to assert that a person untrained in this line would need to be told that they were working. Later, the State Commission of Horticulture received a new parasite for the red and purple scales and sent experts to breed them in the worst infested orchards, but after a lapse of considerable time, they apear to diminish in numbers rather than multiply, and we can place nothing to their credit.

Mealy bugs, Pseudococcus citri, bid fair to be a most serious trouble. They have a number of enemies, one of them, Cryptolemus montrouzieri, but their control of the insect is only partial and so not satisfactory.

Codling Moth.

The introduced parasite for the widespread enemy of the apple grower, the codling moth, Carpo capsa pomonella, is Caliephialtes messer. It works well in confinement when supplied with larvae or cocoons of the moth, but after a number of years' trial in the orchards has no friends to sound its praises.

Cutworms.

The cutworms Agrotis saucia and Peridroma saucia are periodical enemies and general feeders. The moths lay the eggs and later the cutworms emerge. These dark-colored moths may be seen flying in the twilight over the flowers and elsewhere. They usually lay their eggs in March and the worms appear in April. We are troubled with them sometimes once in two years, and sometimes only once in four years. There are two common enemies of this pest, one a large black beetle, Colosoma angulatium, which feeds upon the worms in both larvae and beetle stages. The other enemy is a Tachina fly, Froutina frenchii, which lays its eggs in the worm as it crawls; the eggs hatch out later when the worms are in the pupae stage and the maggot eats out the pupae and in turn pupates and comes out the fly again. I have known as high as ninety per cent. of the worms to be parasitized in this manner so that in the breeding jars I would get that percentage of the flies instead of the moths.

Our common feeders, the Chrysopa Californica and Chilicorus bivulnerus and others feed upon the mites and plant lice to quite an extent. Plant lice also have an enemy in the footless maggot, which devours them in large quantities.

Use Best Mechanical Methods.

To sum the question up, it will be seen by tbe foregoing that we have successful parasites for many of our insect foes, and that others are kept in check to a considerable extent. But, while this is a fact, we should not be too easily satisfied and allow the pests that are only partially controlled to continue to lower the value of our orchards; but we should use the best mechanical methods to control the pests until such a time as the State Commission can secure a parasite that after a thorough test proves itself capable of subduing those remaining.

In this connection I wish to call attention to the insectary which has been maintained in inadequate quarters at San Francisco by the State Commission of Horticulture. At the present time a new building is being erected at Sacramento for the express purpose of accommodating this branch of the work.

Too much cannot be said in commendation of our State Commission for the efforts they are making to acquire perfect parasites for all of our insect enemies.

Continue the Search.

Continuous search is being made all over the world to secure better parasites for some of the scale insects as well as additional ones for others. Comparatively little is known by most of our people of the difficulties to be overcome in this work. Sometimes it is difficult to get permission in some of the foreign countries to make the search. Then after the parasites have been located methods have to be devised to transfer them in good condition to San Francisco. Some of them have been sent on cuttings, some on infested trees, and sometimes they have been collected in tin boxes placed on ice, thus keeping the insects frozen until they arrive at their destination.

The next difficulty is food for them, and sometimes it happens that considerable effort must be made to secure this food in sufficient quantities and in such condition that it will keep until used.

The new building is planned for convenience in breeding and caring for these insects, and it is to be cared for by those eminently qualified for the work, both through experience and technical knowledge.

We may all rest assured that everything is being done by the State Commission and will continue to be done to advance this line of work for the benefit of the orchardists all over this, the greatest fruit growing State in the world.

"Them's My Sentiments."

In closing I will quote a sentnce that appeared in an article by T. H. Comstock in the American Naturalist for December, 1888.

"We hope that tbe time is near when the need of an insectary for entomological work will be as fully appreciated as is the necessity for a propagating house for the horticulturist or a conservatory for the botanist."

I will just add, "Them's my sentiments."

ROMANTIC BUT UNHEALTHY.

Poets have always loved to write verses about the quaintness of the old moss-grown roof. The old "moss-covered bucket that hung in the well" seemed to make the water cooler and sweeter. Painters have always loved to paint their pictures of the old homestead with the steep roof covered with moss,

The modern farmer demands the best he can get, for he prizes health and strength and comfort and long life more than picturesque decay and romantic prettiness. Nowadays, even the shingle-roof is disappearing before the competition of the better and more durable composition roofing. The "Rex Flintkote" roofing, advertised in our pages by the long-established and well-known firm of J. A. & W. Bird & Co,. Boston, Mass., is better than any "moss-grown roof" in the world, better looking to a modern man or woman, and better wearing than the now "moss-grown roof" was when it was new. It sheds water absolutely, turns wind perfectly, lasts for a generation, and is so fire-resistant that you can place a live coal on it and it won't burn. Prove this by sending for a sample to the manufacturers who will also send you a booklet which tells all about roofing.

an orange or lemon crop, I
e must certainly add nitrogen
other form. Perhaps an anal-
the matured cover crop may in-
sufficient quantity of nitrogen
for oranges or lemons, but we must remember that it is not in a form to be immediately available. We have turned under a mass of green vegetation which must first be decomposed, and its fertilizing elements changed into other forms by the action of the soil bacteria, before it becomes available to the tree as plant food.

It seems unfortunate that our winter cover crops mature so late in the season that when we turn under this mass of vegetation it is already so late that our trees cannot get the full benefit of it in time to help the setting of the new crop of fruit. Just at this time of the year our fruit trees need a suitable supply, though not an excessive supply, of available nitrogen; and in order to provide the available nitrogen, it has been the practice with many growers to drag down the growing cover crop, sow a nitrogenous fertilizer on top of it, and then plow under the green crop and the fertilizer together. For this purpose either tankage or dried blood will serve an excellent purpose, provided it is put into the ground early enough. It is very desirable for several reasons and from every point of view, that cover crops be plowed under early in the season, and no later than February; and I feel sure that the amount of benefit that may be derived from their use will depend very largely upon right management in this respect. If the plowing has been done early we may use a dressing of nitrate of soda a little later to good advantage, particularly if the spring weather is cold. We know that the processes of nitrification require a certain degree of warmth in the soil (Snyder says a temperature of 54 degrees to 99 degrees is the most favorable,) and it is well to keep this fact in mind when considering whether to use nitrate of soda in the early spring.

There is another aspect of the matter to be noted, which is that we should not go to extremes in supplying nitrogen. If it be supplied in excessive quantities, plants and trees use it very freely, and in the case of fruit trees we sometimes get bad results. The quality of the fruit may be injured in this way, of which we have often seen evidence in the orange. And, not only is this true, but if the excessive feeding occurs about blossoming time the growth of leaves and stems will be promoted at the expense of the fruit buds, which then develop imperfectly, resulting in a decreased, instead of an increased, fruitage of the tree.

Phosphoric Acid.

There are two other of the fertilizing elements which we must return to the soils in order to maintain their fertility, viz.: phosphoric acid and potash. Nitrogen, as we have seen, promotes the growth and sustains the vigor of the tree; phosphoric acid, it is believed, promotes a large yield of fruit. My idea is that in growing fruits we should supply phosphoric acid quite generously. But the form in which we will get the most benefit from it is a question more difficut to decide; and even scientific men after years of field experiments are not well agreed on the subject.

Soluble vs. Insoluble.

If we buy superphosphates, for example, we will get a large percentage of the phosphoric acid in a water solu-

ble form; if we buy Thomas phosphate powder we will get a high percentage of phosphoric acid with but very little of it in a soluble form, and if we buy untreated bonemeal we will have a material in which a medium percentage of the phosphoric acid is water soluble, but which is all ultimately available to the tree. These three materials, together with guano phosphate, are the phosphate materials we see the most of in California. fornia.

The advantages and the disadvantages of a soluble phosphate may be stated in this way: When soluble phosphoric acid becomes distributed in the soil a process of fixation rapidly takes place, the phosphoric acid uniting with the lime and other alkaline bases present in the soil. This process is what is commonly spoken of as "reversion." If there is plenty of lime in the soil the lime will be the first of these alkaline bases to get the acid, and the reverted phosphoric acid is then just as valuable as it was before, because in this form it is still available to the roots of trees. If, however, there is not much lime in the soil, but a good deal of iron and alumina, these bases will get the acid, which, particularly in the case of iron, would pretty effectually lock it up, and it is in this respect that possible loss of phosphoric acid takes place. You will notice, then, that there is little danger of loss by leaching because the phosphoric acid, by the process of combination, becomes fixed in the soil, and the only loss is in cases where the soil may be very deficient in lime and very rich in iron. Soils of this character are, I think, quite common in Southern California. My understanding is that our soils are, as a rule, rich in lime, and, therefore, we may use phosphates freely in any form without having the phosphoric acid either washed out of the soil or locked up by combination with an iron base.

"But if the soluble phosphate is quickly converted into an insoluble form, it may well be asked what has been gained by all the trouble and expense of converting the insoluble phosphate into a soluble form?" This question is raised in a bulletin of the West Virginia Experiment Station, and the answer is so admirably stated that, although I have quoted it more than once, I think it will bear repetition. The author says the chief advantage is a matter of "distribution." "When the soluble phosphate is applied to the soil it quickly passes into solution, and, as the soil water is never at rest, the phosphate solution soaks through the soil in every direction, bathing every little particle of sand and silt and clay, and gradually being deposited among them as the necessary lime is found. These deposited or precipitated particles are extremely minute, and so expose an immense amount of surface to the action of the soil water."

Then, after speaking of untreated rock and untreated bone, Prof. Hite, the writer of this bulletin says: "The greatest disadvantage of such materials is that when applied to the soil they remain where they fall. They may be scratched about more or less by the harrow or the hoe, but even if the field could be shoveled over or run through the most improved disintegrator and mixer the best that could be hoped for would be a comparatively inert particle here and there. The case is altogether different when the soluble phosphate is used, for the deposited particles are not onl
available when needed but

ive Culture.

have been considering the
on of maintaining the fertility
soil. Let us go a step further.
is the chief object the orchard-
s in view? Is it not to produce
crops of fruit of the finest and
ualit? Does not this imply in-
e culture? We might grow
and healthy trees, of ordinary
ctiveness, by simply maintaining the original fertility of the soil, but to cause these trees to produce yearly crops of fruit which shall be of maximum quantity and of the best quality, may involve far more generous fertilization than we have ever practiced in California.

There is nothing alarming about this. In Florida experiments have been made of increasing the applications of commercial fertilizers for bearing orange trees year by year, and it is claimed that up to eighty pounds of commercial fertilizer to the tree was used with ever increasing profit.

"Room at the Top."

And can we not influence quality of crop by means of fertilization? Proper and improper pruning will influence quality; proper and improper irrigation will influence quality, and so I think we may confidently believe that we may improve the quality of our fruit by fertilization. Not, indeed, by the use of any nostrums nor secret formulas, but in a purely scientific way. Science has not exhausted herself. Science as applied to horticulture, is only in its infancy, and its possibilities are beyond our ken.

As production increases, the question of profitable fruit raising may become more and more serious, but of one thing we may be certain, there will always be a demand for the best fruit. "There will always be room at the top." Our conditions for successful fruit culture are of the very best. We live in the best country under the sun; we have the best climate under the sun; we have the best people under the sun; and we shall fall short of our high privilege if we fail to produce the best fruit under the sun.

THE OREGON CHERRY FAIR.

The annual Chery Fair at Salem, Oregon, is being looked forward to by the fruit growers of Oregon and the entire Pacific Coast with keen interest. Indeed, fruit experts in all parts of the continent are watching this event, as it stands for the best exhibition of the best cherries grown anywhere in the world.

Although the date has not yet been fixed for this fair in Salem, it is safe to say that it will be held in July, as last year's date was July 10, 11 and 12. There is now every reason to believe that a large crop is in store for the cherry growers of the State for this season, as they have bloomed bountifully and, as far as can be learned, they fully fertilized and a large crop of fruit has set.

A PRONOUNCED SUCCESS.

One of the successful houses of California, which has been made so by the push and honest business methods, is that of the West Coast Stock Food Co. It has put up honest goods at a reasonable price. This has compelled the enlargement of the factory, about which Mr. Tompkins, the manager, recently said:

"We have the foundation in for our new mill and warehouse, corner Alhambra and Griffin Ave. We are building a two-story brick, 50x100 and over, and a galvanized iron warehouse, 35x100, which will give us 14,000 feet of floor space, much more than we now have, and what we are now using is more than double what we started with a little over two years ago. This trade has been built up by making good, honest goods at reasonable prices, especially West Coast Chick Feed and Egg-More. We buy all materials in large quantities for cash, and while our present mill has been quite efficient, we are putting several larger and better machines in our new mill, and as it is right on a railway, you will see that we are going to be well equipped for the business."

$10 a day may be earned by a man using our machinery. Some earn more. FULL LINE for prospecting for water, coal, mineral, oil, etc. Any DEPTH, any DIAMETER. PUMPS also. Free catalogue.

Irrigation and Forest

GROUND WATERS IN SAN JOAQUIN VALLEY.

Ground water work in the arid West often bears a most intimate relation to the prosperity or even the very existence of the communities affected. In regions where the annual rainfall is 10 inches or less, so that agriculture and horticulture can be carried on only by means of irrigation, the problem of water supply, whether that supply be surface or underground, is a matter of commercial life or death for the particular community concerned. In those parts of the arid West that are best known and most thickly settled, the available supply of surface waters has, as a rule, been long since preempted, and during a decade or more hydraulic engineers have turned their attention to underground sources as those most likely to provide an increased water product and consequently growth in population and prosperity.

The great San Joaquin Valley of south-central California, embracing approximately 12,000 square miles, is one of these areas whose surface waters are fully utilized and whose engineers are considering the possibility of developing surface water in order that the great agricultural industries now thriving may be properly sustained and encouraged. Recent investigations by the United States Geological Survey lead to the conclusion that this great valley is peculiarly favored in the quantity, quality, and accessibility of its ground waters. They have been utilized to some extent in some areas, notably about Stockton and in the vicinity of Corcoran. In the neighborhood of Stockton hundreds of windmills, many of them home made and of crude construction, are utilized to pump ground waters to be applied to the irrigation of small but intensively cultivated garden tracts. Recently pumping plants have been introduced, and these generally of small capacity, but their increased use in the future is assured by their reliability as compared with a device that can be operated only during favorable winds of sufficient strength.

Corcoran, which is a colony established by enterprising men from the southern part of the State, is located in the center of the great artesian area that occupies the trough of the valley, and its existence from the very beginning has been conjoined with development and utilization of the ground waters. Wells in this region are from 500 to 1500 feet deep and yield waters that rise to the surface in considerable volume. The practicability of the use of ground waters for all agricultural purposes in this region has been proved by the success of the business enterprises dependent upon them. Other colonies have been established farther south in the valley, which likewise depend upon artesian or pumped waters, but they have not yet reached the advanced stage of development that distinguishes the colony at Corcoran.

THE KNACK OF SAVING WATER.

This is the year in which it will be necessary to save every drop of water that may come down the ditch. The quantity of water which plants use is but a small part of that diverted from streams for irrigation purposes. Large volumes are lost by absorption and seepage in the earthen channels of canal systems. losses occur in the ditches supply farms and a large part remainder is wasted in ir crops. The farmer is chief cerned in lessening the w water in his supply ditch and farm. In localities where w likely to be scarce, the suppl should be made water tight by the channel with cement or cement plaster, asphalt, heavy oil or clay puddle. Flumes or may also be used as a subst an earthen ditch.

One of the most common sou loss of water is poor preparat the surface. When the so gated by flooding from field an uneven surface causes waste of water, extra labor ing it and smaller yields. Th flows into the low places w ceive too much and may waterlogged while the high left without water and thereon is dwarfted. The tween field laterals sho evenly graded that water w a thin sheet over the entir the excess being caught lower lateral.

Another common cause of the lack of attendance. W often turned onto a field a mitted to run without atten hours and even days. On farms the irrigators look af water for ten hours and tur for the remainder of the d der this practice the low pa ceive too much, the high pl or none and a large part flows field to the injury of the rea adjoining farms.—Denver Fie Farm.

A VALUABLE TREE.

A visitor at the Cultivator o suggested that a tree little pl this State, which should be of value is the Jarrah or Eu marginata. This tree grows to size, is slender and straight. Australia one of the best for t piles, and is of great comme portance.

But we note in the Cultivator that at the station at Santa "the specimens grew ex slowly, finally perishing fro So far as experience there where in Southern Californi species is worthless for plan This is to be regretted, for if the ber is as represented, and the no reason to doubt it, all that be grown here would find a ready ket when mature, for piling, r ties and other uses under water ground. It would be interestin test the Jarrah in a moister lo Possibly it might do better there."

That was nearly ten years ago. any one more recent information.

RAINFALL ESTIMATE.

An acre contains 6,272,640 squ inches of surface, and an inch of r means, therefore, the same number cubic inches of water. A gallon c tains 277.27 cubic inches of water, an inch of rainfall means 22,622 ions of water to the acre, as a lon of water weighs ten pounds, rainfall of an acre is 226,220 poun

One cubic foot of water per seco equals 50 miners' inches, or, miners' inch is .02 cubic feet per s ond.

The Vegetable Garden

ENRICHING GARDEN SOILS.

Pure clay comes from the decay of what is known as feldspathic rock. The rocks are composed of silica and alumina and in which generally potash, soda or lime are present. However, average clay not said to be pure clay may be the result of the decay of those rocks known in geology as crystalline rocks; that is, those whose structure is such that they do not contain any organic matter. As to improving clay soil we need but note the materials in which the clay is deficient, and if those can be supplied, we have solved the problem of improvement. If clay is the result of the decay of rocks that contain no organic matter and if a productive soil is the result of proper union of organic matter and decayed rocks then we can logically conclude that to make clay soils productive organic matter must be added. But of what should the organic materials consist? Should they be added fresh or well decayed? Should they be applied on top the surface or should they be plowed under? What other attention may the farmer give the clay in connection with the application of organic matter to make it a productive seedbed? These are questions that always arise in the minds of the farmers.

Add Organic Matter.

Anything that will add organic matter to the soil will improve clay soils, consequently barnyard manures, coarse straw, the plowing under of legumes or any green crops that will improve the mechanical condition, will also add humus and, consequently, will increase the supply of nitrogen in the soil. Of course, barnyard manure is the best as well as, usually, the nearest material at hand for the average farmer to apply to his soil. Farm yard manure, besides adding organic matter or humus, contains a great deal of plant food which is also given to the soil when the manure is applied. In this connection the question is often asked what kind of manure is best adapted to the needs of the clay soil.

Best for Clay.

Scientists tell us that horse, sheep and hen manure are best for clay soils for several reasons, two of which may be given as follows:

First, they are dry and "hot" or heating manures and, since clay is usually wet, and "cold," these manures have a tendency to absorb the surplus moisture and increase the temperature. Second, they contain a great deal of nitrogen, the very element in which clay as a rule is lacking. By being sure that the urine of the horse is saved the amount of nitrogen is greatly increased.

Apply Fresh.

Experiments show that the manure should be applied to clay soils fresh, because fresh manures contain more nitrogen than well rotted manures. Then in the decay of the manure mineral elements in the clay are acted upon and made soluble for the needs of the plants that are to grow thereafter upon the soil. We are told that the decay of any organic matter creates a material known as carbolic acid. This has power to act upon the potash and other minerals contained in the soil and make them ready for the plants' use. In this way if the manure is fresh it not only gives nitrogen to the soil but in its decay it renders the unavailable mineral elements ready for the use of the crops to follow. If the manure is well rotted it usually does not contain its full amount of nitrogen and then in not undergoing its first stages of decay in the soil the mineral elements are not decomposed.—Journal of Agriculture.

ONIONS GROWN FROM SEED.

Onions will do well in almost any garden soil that has been kept free from weeds and grass. The soil can be made fine and loose by deep spading, and as it is impossible to get the soil too rich, both stable manure and commercial fertilizer high in nitrogen may be applied. This is not done, however, until about two weeks before planting. Use it in the drill at the rate from one to two thousand pounds an acre.

Make the rows from one to two and one-half feet apart and sow the seed at the rate of from five to seven pounds per acre; a seed drill will do the work faster and more evenly than by hand. Cover the seed with one-fourth to one-half inch of soil, which, if dry, at the time, must be pressed down firmly to insure good and quick germination.

Commence cultivation as soon as the plants are well up and stir the soil between the rows every two weeks, and oftener if necessary, to keep it fine and loose and to prevent weeds from getting a foothold. When the plants have attained the size of a large broom straw, thin out to one plant every four or six inches. Nitrate of soda, applied at the rate of 150 pounds to the acre, will hasten their growth and greatly increase their yield. When the plants begin to make bulbs early in the summer remove the soil from around them (so that one-half, or more, of the bulb is exposed) to increase their size.

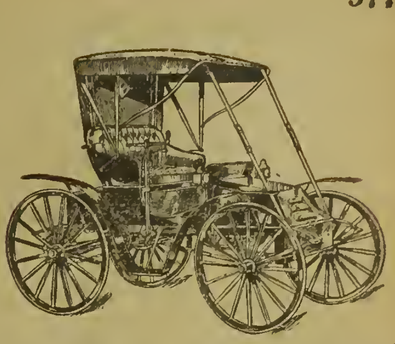
When the tops die down, the onions are ready for pulling up. After this, if there is no danger of rain, leave them in the sun a day or two to dry. Store in a cool, dry place.—Garden Magazine.

A FINE, FIRM SEED BED.

All crops need a fine but firm seed bed. This is particularly true of corn, potatoes and barley. The soil should be fined to the depth of several inches and later firmed by harrowing, etc. There is only one time that you can cultivate right under a stalk of barley, corn, or potatoes, and that is before it is planted. There is where the plant first lives in the soil in contact with roots. Small fine feeding roots can not get plant food out of lumps of earth. They must have fine soil to do their best.

Choose some place where you can have a hammock; make some rustic seats, and if you have small children, furnish them with a swing. Let them have a picnic some of the pleasant days, by taking what they were to have at the table, outdoors, under some shady tree. They will think it fine fun.

It is the green-clad yard, with attractive flowers, trees laden with fruits and vegetables, that make the sons and daughters cling to home, and parents.



The **RELIABLE DAYTON** MOTOR CAR
Catalog free.

The first real successor to the horse

The Reliable Dayton Motor Car is not a luxury but a necessity because more ecomical efficient and rapid than a horse. Saves time—saves money. Simple to operate. Staunchly built of best quality materials and the only motor car on the market today which has actually proved satisfactory in year around service—winter and summer—good roads and bad. Solid rubber tires, hence no punctures or tire expense. Twenty-inch road clearance. A Reliable Dayton Motor Car makes it possible to keep your horses in the field earning for you. Will take you to town and back in one-sixth the time it now requires. Ready when you are, for one mile or a hundred—requires no attention when not in use and eats only when you use it. Let us send our catalog illustrating and describing all models. Prices without top: 2-Passenger Car, $788; 4-Passenger Car, $925.

PRODUCE MARKETS.—Los Angeles Market; San Francisco Market; Citrus Markets, 590, 591.

CONSERVATION.

President Roosevelt is nothing if not original and resourceful. The Governors' Conference is only another proof of that. The advantages of such a conference were not at first seen by the mass of the people and perhaps not fully appreciated by any of us yet. We believe time only will show us this. Regarding the object of the conference, the president said:

"This conference on the conservation of natural resources is in effect a meeting of the representatives of all the people of the United States called to consider the weightiest problem now before the nation, and the occassion for the meeting lies in the fact that the natural resources of our country are in danger of exhaustion if we permit the old wasteful methods of exploiting them longer to continue."

To most of us on the Western edge, the conservation of our water and our forests is all important and fully appreciated by us, but this conference has plainly shown that a vast number of our natural resources must be cared for or loss and suffering will surely follow.

"Finally, let us remember that the conservation of our natural resources, though the gravest problem today, is yet but part of another and greater problem to which this nation is not yet awake, but to which it will awaken in time, and with which it must hereafter grapple if it is to live—the problem of national efficiency, the patriotic duty of insuring the safety and continuance of the nation. When the people of the United States consciously undertake to raise themselves as citizens, and the nation and the States in their several spheres, to the highest pitch of excellence in private, State and national life, and to do this because it is the first of all the duties of true patriotism, then and not till then the future of this nation, in quality and in time, will be assured."

IRRIGATION—DRY FARMING.

The unfortunate distribution of this season's rainfall will give impetus to both irrigation and to arid farming. Many sections of the Sacramento valley where the vast wealth of water is allowed to escape each season to the ocean are considering methods of conserving and distributing the water. Such a season as this will give zest to such considerations and cause an earlier bringing about of those great movements which are continually increasing California's wealth.

On the other hand, many sections in California where it is not possible to secure the aid of irrigation, are studying more and more the benefits of "dry farming." That is, how may the soil be so handled as to conserve every drop of rainfall and make it come forth months later in bountiful crops.

The Cultivator recently referred to an example in San Fernando valley where a crop of barley five feet tall had been grown without a drop of irrigation. Other sections have done equally as well and all cause the careless farmer, or one who has not studied into the question, to ask: "Well, how do they do it?" Those who are accomplishing these results think nothing on earth is simpler. It is simply through preparation of the soil to receive every drop of rainfall, thorough packing of the subsoil and the maintenance of a dust mulch to prevent the loss of any of the moisture. As some have expressed it it is the farming of the entire crop before the seed is planted.

If this season will teach the two lessons of greater care in conserving and holding the moisture in the soil, and the saving the floods for summer irrigation, it will be a great lesson for California.

COMMUNITY BREEDING.

We note in a Utah exchange that that State is becoming noted for some of the finest Percheron horses in this country. It has been advised there that all other breeds of draft horses be eliminated, and that all breeders of the State center on that one particular animal. If this be done, in time—and not a long one, either—the State will be noted for the fine horses of that breed and a market will be created which will attract buyers with a long purse.

California conditions are so diverse that she may not, perhaps, as a State take up any one line of breeding, but if various communities would take the lesson which Utah is learning, and some other western communities as well, a business would be built up which would prove exceedingly profitable. When the government wishes a big bunch of army mules, the one place they are sought is Missouri. Kansas is rapidly securing the name for the finest hogs in the world. Some sections of the north middle-west are becoming equally well noted for high-grade dairy cows. Some sections in the central part of this State are becoming known as breeders of exceptionally fine short-horn or Holstein cattle.

If a large buyer wishes a particular article, he is far more inclined to go to a large center of production than he is to go here and there over a great scope of territory seeing a single breeder, thence to another town to find another in the same line. The lesson to the California farmer should be obvious.

SELL ONLY THE BEST.

We have little patience with the plan which some farmers have had of giving to their own families culls or undesirable products of the farm and sending all of the good to market. Neither have we patience with the farmer who lowers the tone of the market and injures his neighbors by sending undesirable fruits to be disposed of. Often stuff is sent to the fruit stands, or to the peddlers' wagons which should never be allowed to leave the ranch. It would have made a good marketable product if changed into pork or fed to some animal which would have made it a first class product; or, again, it might have been worked up into high grade products such as marmalade, vinegar, fruit juices or other first class articles which would have commanded good prices.

Some poultrymen will at this season put in cold storage fresh eggs which they will take out a few months later when prices have doubl and indiscriminately mix the cold storage wi fresh ranch and work them all off as a strict fresh article. We were once on a ranch at whi this was being done, the farmer having stored h eggs several months before. As he would dri to market with one case he would return anoth from the storage and the next day take a case more which he would sell as strictly fresh s oc This dishonesty will, in time, affect him as we as all of his neighbors who may possibly b e gaged in shipping only the freshest stock

Orange-gorwers have learned this lesson a higher grade of fruit is being forwarded ha ever before. It is proving so profitable that w presume this movement will grow and that th grade of oranges and lemons will be made co tinually higher.

Let other products follow suit.

SULPHUR MAY BE USED.

In response to the demands of the fruit men of California, a commission wa pointed to inquire more fully into the q of the injurious effects of sulphur in dryin This commission will not make any inqu the matter for the next eighteen months, practically means not at all. Prof. Wile dently stirred up a hornet's nest when he his edict against the use of sulphur in fru ing, which, if carried out, would have mean destruction of an important industry in C nia. Our people have protested against th of Prof. Wiley, and have protested with good effect that the matter has been lef for a year and a half, by which time it w forgotten, and sulphur will be used as her in the preparation of dried fruit for the m

If sulphur is really detrimental, as W claims, then it should be prohibited, b should not be on the barren assertion of an man, even if he be a scientist, and the fruit ers of California have arisen and demande they be heard in the defense. Sulphur, as in the preparation of dried fruit in this S rather beneficial than detrimental, as there small a portion of it left in the fruit that not possibly do injury, while in the destr of insect life and the prescrvation of the fr is of absolute benefit.

LEGISLATIVE COMMITTEE.

Hon. J. W. Jeffrey, State Commission Horticulture, has appointed the following L tive Committee authorized by resolution a State Fruit Growers' Convention held at Ma ville, California, requesting the State Com sioner to name a committee to assist in re ing the horticulture laws of the State and adv before the Legislature the enactment or ment of such measures as may be necessar A G. Kendall, Sec'y Citrus Protective Leagu 829 H. W. Hellman Building, Los Ang James Mills, Sup't Arlington Heights Ra erside, Cal.; D. G. Overall, Fruit Grower, Cal.; Arthur Briggs, Pres't Board of Trad Francisco, Cal.; Peter J. Shields, Judge Su Court, Sacramento, Cal.

Mr. Kendall has been authorized to a Temporary Chairman of the Committee and s have been taken to secure a meeting of the C mittee early in June at Sacramento.

GROW THEM AT HOME.

We note in an estimate of the impor this country of tropical and subtropical prod that those items take from this country app mately $600,000,000. Nearly half of this immen sum went for cane sugar. Walnuts, almond ar many fruits which may possibly be grown this country were also strong factors in makin up the totals.

Producers of California and other sectio where subtropical fruits may be grown, shou take a lesson from these immense figures and d termine, so far as possible, to aid in producin crops which will keep that sum within our ov pocket books.

It is pleasing at last, says Field and Farm, assure the public that the fool fake represent by the Spencer seedless apple has finally wo itself out. It was a struggle to put down t fraud, but like all other things of similar sort has had its day. It has virtually dug its ov grave for the scheme is dead beyond recall

Central California

Apricots are being thinned in the Pajaro valley.

Watsonville forwarded its first cherries on May 8th.

Some apricots are cracking badly around Watsonville.

Apricot thinning has been finished in the Pajaro valley.

It is safe to say that prices for hay will run high during the coming season.

The Sanger winery has increased its storage capacity by 250,000 additional gallons.

Modesto irrigation district has taken great strides forward within the last few years.

Experts of the Department of Agriculture have just concluded a soil survey at Oakdale.

Many orchardists at Turlock report extremely heavy setting of practically all varieties of fruit.

The Kings County Fruit Growers' Association recently held an interesting meeting at Lemoore.

A limited planting of walnut trees has been made during the past planting season in Tulare county.

The last rain gave Tulare county an inch precipitation and will help greatly in maturing the hay crop.

Strawberry culture is becoming quite popular near Bakersfield and some profitable plantations have been made.

The State Game Commission reports that 250 lions have been killed in this State within the last six months.

One apricot grower near Bakersfield reports that he expects to have 75 tons of apricots from 700 thrifty trees this season.

The Central California Produce Company of Turlock now has a regular representative in the San Francisco market.

A Tulare hunter has pulled down a $20 bounty for killing a mountain lion in the mountains in the eastern edge of Tulare county.

Spraying with the Bordeaux mixture has been so general in Watsonville apple orchards that the scab is almost unknown up to this time.

The Ladies' Forest and Song Bird Protective Association of San Jose is taking active steps to protect the forest trees of the Big Sugar Basin.

Orchards in the Pajaro valley have shown such a heavy drop that some, especially of the Newton Pippin and Bellefleur varieties, will have a much lighter crop than desired.

Kern County Producers & Exchange Association met recently and discussed matters of co-operation amongst the farmers, and also scientific methods of soil culture.

The levees built along the banks of the Kings river have not been tested by storms this year, which is the first season in some time in which there has been no concern regarding breaking of the levees.

Sugar beet farmers in Salinas valley are much concerned over myriads of bugs that feed upon the plants as soon as they come through the ground. Efforts will be made to study into the life and habits of the bug and find out how to control it.

Southern California

Whittier is to have a flower show.

A big sugar factory is now assured for the Imperial valley.

Planting of eucalyptus is quite extensive in Ventura county.

Extracting of new honey in some sections has already begun.

Farmers near Whittier report fine outlook for grain and hay crop.

Most interesting farmers' institute was held at Highlands last week.

El Centro creamery is now sending out 1000 pounds of butter per day.

El Centro is making experiments in the effort to locate an artesian water belt.

Pomona fruit growers estimate a fair crop of apricots in that section this season.

Farmers in Imperial Valley are making an effort to establish a mutual telephone system.

The cantaloupe crop of the Imperial valley this season is said to be worth fully $1,000,000.

Much interest is manifested in the planting of oranges all over Southern California this season.

California Development Company plans for the expenditure of $1,000,000 in Imperial valley this season.

Cabbage are still in the dumps and many carloads at Fullerton have been held awaiting a better market.

The Waters cannery at Pomona is planning for a big pack of apricots, peaches and tomatoes this year.

The pre-cooling plant built at Highlands for cooling oranges before shipping has proven an entire success.

The newest townsite in Imperial Valley is "Meloland." We assume from this name that it is a melon section.

The lemon orchards near Colegrove containing over 30,000 trees have been treated to a thorough fumigation during the last few eeks.

The last storm brought to the foothills back of San Bernardino a precipitation of 1.85 inches. This made a total in that district of 34.4.

Fruit growers at Plancentia have organized a Growers' Protective Association and propose to protect their property.

The output of honey will be short of the average this year on account of scarcity of late rains. Last year's output of Southern California was 275 carloads.

Promise for a walnut crop in Southern California is now of the best. The season has been exceptionally favorable so that there is but very little blight.

"Eternal vigilance with rigidly enforced quarantine laws is the price of the immunity from scale pests" is the verdict of S. A. Pease, Horticultural Commissioner, at San Bernardino.

The Gold Buckle Orange Association recently organized at East Highlands is prepared to engage in the handling of the members' fruit; $65,000 of its capital has already been subscribed.

Southern California ships about 500 cars of cauliflower between November and April of each year, 1000 carloads of early cabbages, 1000 carloads of Bermuda onions and several cars of a day of tomatoes between the months of October and February.

The Coast

Alfalfa in Colorado has been somewhat injured by the winter freezes.

Indications are excellent for big yield of hops in Lane county, Oregon.

The Oregon Cherry Fair will be held at Salem, Oregon, beginning July 10th.

More than $5000 will pe paid to Lewiston Clark orchardists for the coming year.

Corvalis had a live stock show at which there was a large attendance last week.

Spokane sometimes received as high as three cars of California oranges in one day.

Smudging has proved effectual with growers in Colorado and saved many crops this year.

Colorado interstate fair and exposition will be held at Denver, September 7th to 12th.

A Pittsburg syndicate has acquired and will parcel out 10,000 acres of land near Kiona, Washington.

Preparations are going forward for the eastern Oregon district fair to be held at Pendleton in September.

A farmer at Colfax, Washington, has found success in killing coyotes with bisulphide of carbon placed in their holes.

It has been found that wolves are killing and reducing the herd of buffalo near Westminster, British Columbia.

The rainfall has been so light in Colorado that dry farmers question as to the advisability of putting in many crops.

A botanical garden is to be a feature on a large ranch west of Denver. It is claimed that it will rival any in this country.

Two thousand acres of dry land along the Columbia river are to be supplied with water raised by means of gasoline engines.

Producers of Arizona have appointed a committee to labor with the managers of railroads to secure more favorable shipping rates.

Tillamook county, Oregon, is proving to be a fine field for dairying. Of cheese alone there was produced last year nearly a half a million dollars.

Fruit men of Walla Walla county, Washington, are advocating a law compelling the spraying of fruit trees, which should be done before April 10th.

Utah wool growers have decided to store and hold wool until better prices are offered. It has already proven a stimulus to the wool market in that section.

Portland rose festival will be held in the city of Portland June 1st to 6th, at which time "roses fragrant, roses rare, roses, roses, everywhere" will be the slogan.

A mutual company owning some fine live stock at Davenport, Washington, recently met with the loss of their famous black stallion, Rosenburg, which cost the company $8000.

The following are the officers recently elected of the Idaho State Horticultural Society: President, Judge Fremont Wood, Boise; vice-president, Prof. J. R. Shinn, Moscow; secretary-treasurer, F. E. Price, Payette; directors, Captain J. H. Shawhan, Payette, and Carl A. Davis, Mountain Home.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:

"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

TO THE HEN.

Oh, feathered queen, thou precious hen,
The greatest fowl in all the nation,
Accept this verse of admiration,
Thou best of boons to many men.

Although deep science may conceive
To imitate their incubation,
The sorry time will ne'er arrive
When hens are lacking occupation.
—Agricultural Advertising.

LEGHORNS.

THE Leghorn fowl is, perhaps, more popular in California than any breed of fowls recognized by the American standard of perfection. In fact, taking the report of 124 shows held last season, whose secretaries reported to the American Poultry Association, the number of Leghorns exhibited stood third, only being out numbered by the Plymouth Rocks and Wyandottes. These 124 shows represent all sections of the United States and Canada.

But we believe if we could get a correct list of all fowls bred in California we would find that the Leghorn headed the list.

Of the Leghorn family there is recognized in the Standard eight varieties comprising the Single and Rose Comb Brown; Single and Rose Comb White; Single and Rose Comb Buff; Single Comb Black and Silver Duckwing. Of these eight varieties the White is the most popular, perhaps there are more White Leghorns bred today in California than all other Leghorns.

History.

So far as we are able to learn there is no authentic information obtainable as to the origin of the Leghorn fowl, as it is bred today. About the only information pertaining to its early history that we can get is, that they were the common fowl of Italy. A suggestion has been made that it is the old Roman fowl, but the suggestion has never lagged long enough to be considered. When the Leghorn was first imported it was commonly stated that they were produced by crossing a black-red game with a White Minorca, but beyond this nothing can be learned that can be relied upon.. The first importations to this country were the Whites, Browns and Blacks.

The Leghorn of Italy is not the non-sitter our Leghorn is today, for fully 20 per cent of them become broody, which is enough to continue the race.

Economic Qualities.

The qualities of the Leghorn are too well known for us to enter into very deeply, yet we cannot pass the subject without a word in regard to their economic values. The Leghorn is considered one of our best layers and many strains lay the largest eggs of any of our domestic fowls.

The Leghorn is also a good forager and will do as well under indifferent conditions as any fowl we have today. This is one of the chief reasons for its popularity.

We have heard Leghorn breeders say that they could grow more meat in six or eight weeks with Leghorns than with any fowl. This we can neither affirm or deny, but we know that they make a very rapid growth and are very vigorous under conditions.

Size and Type.

Size and type are two p should not be overloo the Leghorn was given u yet the Leghorn as we our shows is truly an Am duction. Not even do the breed them with that syn style and finish that we do left to the American fanc out and give the finishing this popular breed.

We believe when it co the White have the adva the other varieties. This due to the fact that the the White did not have close on account of color more of their energies t shape.

Cheerful
Chickens

Nature intended the hen to make her own living, hence she cannot possibly be healthful, happy and prolific *in confinement* unless bodily functions operate in nature's own way.

Therefore "cheerful chickens" and a full egg basket are possible only when the hen is taken back to nature by a common-sense method of feeding.

DR. HESS
Poultry
PAN-A-CE-A

gets at the bottom of the poultryman's troubles by creating and maintaining an absolutely healthful condition of fowls in confinement. It contains the bitter tonics to aid digestion, iron to make good blood and nitrates to expel poisonous matter.

It is the prescription of Dr. Hess M D., D.V.S.) and, by aiding the hen o assimilate the food, it makes abundance of eggs. Poultry Pan-a-ce-a possesses a germicidal principle which makes it specially useful in preventing disease. Endorsed by leading poultry associations and *sold on a written guarantee.* Costs a penny a day for 30 hens.

Speaking of incubators, will say that you do not want to listen to every Tom, Dick and Harry. Simply follow the directions of your machine. The man who made your machine should know how to operate it better than any one, therefore, follow his directions. It does not matter what results your neighbor had. His may be an entirely different machine and, therefore, may require different operation.

* * *

Jacob Hope, the famous pet stock dealer of Philadelphia, was showing a reporter one of his phonograph-trained parrots, a truly marvelous bird.

"This parrot isn't like the 'Uncle' one," said Mr. Hope. "There was a Nicetown man, you know, who had a parrot that he once commanded to say 'Uncle' in front of a roomful of guests. The parrot could say 'Uncle' beautifully, yet though the man pleaded with it nearly an hour, it remained as silent as the grave.

"Then, enraged, he snatched up the obstinate parrot, ran with it to the chicken coop, and, half-twisting its neck, threw it in among the hens.

"After his guests were gone he regretted his cruelty. He went sadly back to the chicken coop to see if the poor parrot was dead.

"Opening the door, he frowned. Ten of his twelve prize Plymouth Rocks lay corpses on the floor, and the parrot was standing on the eleventh, twisting her neck, and creaming:

"'Say "Uncle," durn ye; say "Uncle."'"

* * *

A FREAK.

I send you photograph of rooster from which I am trying to raise a new strain of fowls. Many of the pullets and cockerels show his peculiarities. How does he look to you?

One of the pullets hatched on January fourth, laid her first egg on Easter Sunday; she laid again on Monday, Thursday, Friday and Saturday, five eggs the first week. The egg laid on Friday is as large as a small Leghorn egg, the others about a third smaller. The poultry fanciers here say this is a record. I know it is a good record, but do not know just how good. The rooster has the markings of a Barred Rock, but one of the pullets is jet black. My hens are all Rocks.—Byron H. Cook, Imperial.

The pullet certainly is making a record as a layer. If she looks anything like the picture of the cock bird you sent, she is no beauty. The bird whose picture you sent has some frizzle blood in him. The feathers look as if they turned toward throat and he is surely a peculiar looker.

THE HEN AND HER NEST.

Many claim that the nest should be on the ground; but all claims that hens should have their nests on the moist ground are unsupported by facts, says Green's Fruit Grower and Home Companion.

What is required for the hen in winter is a snug, warm location; while in summer she should have a cool place.

The best material for a nest is dry earth on the bottom, with chopped hay over the earth.

Then dust the nest, hen and eggs with a good insect powder, and put a small quantity of tobacco refuse in the nest.

Should an egg be broken, or the nest become foul, clean it out thoroughly. The broken egg will cause lice quicker than anything else.

INCUBATORS at COST

We Are Overstocked on "Old Trusty"

Incubators. We are going to sell them at cost just as long as they last. We have about sixty machines, all sizes. We do not want to have to carry these machines over until next Fall. We want to get our money out of them quick. The price we will make is the absolute cost of these machines and not a cent profit. Buy them as long as they last at the prices below. We can sell these sixty machines inside of ten days at these prices. Buy today—send your order direct. One hatch will pay for these machines. These Old Trusty Incubators are all hot water incubators heated by a system of genuine 12-oz. cold rolled copper pipes, which will last a lifetime. The very best safety lamp, the very best Sheer patent regulators, deep four-inch removable nursery drawers and all modern conveniences with every machine. First grade tongue and grooved redwood, double walls, double top and bottom. All we want is to get our money back and first come first served at these prices. I don't care if you buy a carload of Old Trusty Incubators you can't beat this price. We paid spot cash for 660 Old Trusty Incubators, and that's why we can make the low prices. Times have not been as good as usual, and we need the money and must get it. Now is the time to get a machine lower than you will be able to do again. Same big reduction on the brooders, 25 of them as long as they last. No incubator company on earth can duplicate these prices. Try to get them to do so, and see.

WON SOME PRIZES.

The Cultivator is in receipt of a circular giving the winnings of the Garden Valley Poultry Yards, owned by W. S. Sullivan & Co., of Agnew, California. This circular just gives the premiums won last season by the above firm. They showed at Sacramento, San Jose and Petaluma, and from the list of prizes, cups and trophies, that they carried off we imagine there was not much left in the Buff Orpington alley for their competitors. Mr. Sullivan has been a breeder of Buff Orpingtons for a number of years. He understands breeding, perhaps, as well as any one on the Coast today, and has had great success in producing high class exhibition specimens.

He not only looks after the exhibition points, but he takes good care of the utility points as well. Any one desiring either good stock or eggs would do well to correspond with him, as we know he is thoroughly reliable and has the goods.

THE BLACK-TAILED JAPANESE BANTAMS.

Of the six varieties of Japanese Bantams, the black-tailed is supposed to be the original. They have become quite popular in the last few years, and many fine specimens can be seen on exhibition at our largest shows. They require great skill in breeding to produce fine specimens. If a breeder can get 30 per cent of standard birds, he can consider himself very fortunate. Japanese Bantams are the most odd of any of the varieties of bantams. They should have very short legs, wings carried drooping almost to the ground, the combs single. They should be solid white, except tail and wing flights. Tail should be solid black with long sickle feathers, which in good specimens are laced on the outer edge with white. Wings when folded should show only white, when spread will show primaries dark, edged with white, the carriage should be so that the back of the head and tail will touch; legs and feet yellow; comb and wattles bright red.

In mating select the very best marked specimens with short legs. I usually mate one male to three females. They are good layers of small white eggs. Young chicks are tender up to eight weeks, after this if kept out of the wet grass and provided with good dry quarters, will thrive nicely.—The Southern Fancier.

HOW TO WHITEWASH.

First, take an old broom and dust off the walls and ceiling, sweeping your house thoroughly.

The main ingredient in whitewash is lime—building lime, not chloride of lime.

Get one-half bucket of good building lime and pour over it sufficient hot water to cover. The hot water will slack it in about thirty minutes. When it is well slacked, strain through a piece of window screen, or any screen with a mesh of that size. After screening add sufficient hot water to make the liquid the thickness of molasses, then add one cup of table salt and reduce to the thickness of cream by additional hot water. Stir about fifteen minutes until every particle is thoroughly mixed. The whitewash is now ready to apply and when using it, be sure that you reach every crack or opening where a louse can hide and live.

After the whitewash is dry it will be hard and firm and will not crack or chip off for a long time.

The salt acts as a sort of gl at the same time produces a fumes caused by the action lime on it.

This whitewash is a first clas fectant and will not injure y in the least. I have used it eral years and can recomme Reliable.

Don't put the eggs in a d where the hen will be forced down on the eggs to get at she will be pretty apt to br of them. Should any of the broken at any time, the them should be washed discovered, for a smeared e hatch.

The proper dimensions for a b which to set a sitting hen ar 12 inches square. If smaller apt to crowd the hen and the are liable to be broken; if larg eggs will scatter and will not incubated. The box should be p on its side, so that the hen may easy access to it.

When you are saving eg hatching only the perfectly sh ones should be saved. Dirty rough-shelled eggs are not good hatching. Turn them every day they are put under the hen, w should not be any longer after egg is laid than is possible, for germ of the egg becomes we every day.

One reason why women gener succeed well with poultry is bec they are more considerate of wants and necessities of fowls men. But they do not usually so much about what they do.

HORSES.

culties that dealers and ıave in matching horses pair of horses of even ıd disposition that move more valuable than the two animals would be as The fairs recognize how to secure good matches the roadster class of d that move alike, the secondary consideration. acramento Fair one year, ze go to a span, one a other a grizzly roan. inly moved alike and ıme form, yet no one even considered them as driving span. This was matter to the extreme, I in judging this class of udge should allow a prize that are so badly mis- color that they would not d as fit to drive together. e, a sorrel and bright bay pass, while a bay or sor- asily pass when mated , grey, black or brown. l or any of these combina- reatly lessen the selling span. Even a blemished lored closely to his mate, leable than cross-matched

that raises a few horses each year can readily mated by breeding for the making matched teams. ımber of brood mares are a sire carefully that has ge horse style, then breed three or four or more to orse. If the cross produces ng colts, breed to the same long. Now if the mares ı lot, the colts will still be same blood. Keep the at two years and half old to another equally care- ted sire. These will be er now of the same blood. ling the first mares to the and their offspring to the soon a goodly number of s are obtained of the close- blood and will grow more e stock on the ranch be- re and more of the same . The disposition or tem- of the young horse will be well as their forms and hen a number of mares to the same horse per sire is reduced consid-

community there are some ery fast sires as well as dsome sires of equally good The larger sires should be y the farmer. Not less teen hundred weight horse. give a good all around colt has not style for a carriage ill make an expresser or a se. Select a sire that has bones, with a good flat leg supple pastern joints. One ort-ribbed and one that has spirit, without being vicious. rood mare has given the ee or four colts, without some special reason, she paired with another animal There is very slight losses ng young mares; the older grows the more troublesome the care becomes. The colts of young mares are more vigorous than from the older animals. When the mares are sold off at seven or eight years old they are in their prime for the city market or for farmers' brood mares.

Cripples.

One thing that does not pay is to breed crippled mares or diseased ones. They will not raise good colts if the troubles are others than accidents. If they are accidental cripples, then they must be fed and all the value is for the colt. This is paying more than is necessary and without the animal breeding in question is of very great value, it wil not pay.

Just leave these things for the other fellow to do. That fellow that knows it all. The failure to make good financial returns on a ranch comes from these little things. These little leaks. There are the little foxes. The man who has nerve enough to have mercifully killed the cripples of his stock has the making of a financial success close at hand. The feed of a cripple is as great as that of a good horse or colt.

Working the Mares.

The mares that work to within four weeks of foaling will give more vigorous colts than the idle animal. The grain fed the working brooding mare should be liberal and the work steady pulling and not jerking. The exercise and grain makes the colt have better bones and sinews. When the colts are eight weeks old the mares can be put to slow work; hay hauling and the like is good work for them. On a vineyard or orchard the mares are bred either very early or late in the season. The early bred mares come in for January and are ready to do the cultivation during March and April and on for the rest of season, while the late bred ones coming in in July and August are ready to do their work in the raising, hauling and in the grain plowing in the winter. Many men that drive their own teams work the mares right up to foaling time and then in two weeks after the colt is dropped; with the hired help of the farms this is not advisable. The mare must be allowed to cool off before nursing the colt or the milk will not be good. In work that the colt can go along with the mother, it can be let run and learn early to be controlled. A colt raised in this way hardly has to be broken when harnessed up for the first time. It is a case of train up the child in the way it should go when old he will not depart from it.—M. E. Sherman.

HOME TREATMENT OF UDDER TROUBLES.

Cows are very subject to inflammation of the udder soon after calving. The sudden distension of the bag with milk produces tenderness and irritability of the udder and particularly of the teats. This in some cows shows itself in the forms of sores or small cracks or chaps, and these are very troublesome. The cow suffers much pain in the act of milking and is often unmanageable. Many a cow has been ruined, both as a quiet and plentiful milker, by bad management when her teats have been sore. It is very difficult to heal these sores or cracks, as the milking twice a day keeps them open and irritated. The sides of these cracks become hard and caloused, while they remain open and raw at the bottom.

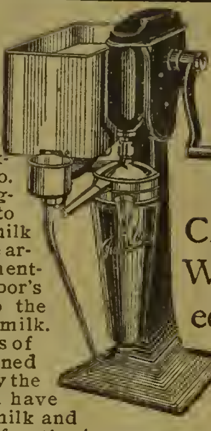
Tubular Gained $30 More in a Month, for Cream Alone, than Whole Milk Yielded. Hauling and Time Losses Also Saved.



In February a certain man wished to try an experiment with a Tubular separator He wanted to know by actual test exactly what the Tubular would do.

He had no cows so he arranged with a dairyman neighbor to make the experiment with the milk from the dairy of the latter. The arrangement was for the experimenter to skim the milk at the neighbor's dairy, and the cream to go to the creamery instead of the whole milk.

The dairy owner feared a loss of cream in this way, and so bargained that the experimenter was to pay the difference between what would have been obtained for the whole milk and the money actually received for the cream.

At the end of the month Mr. Dairyman was surprised to find that the cream had returned him $30 more money than the factory would have allowed him for the whole milk.

Sequel—Next day the dairyman and two neighbor dairymen each bought a Tubular separator. and then hired a man out of employment to kick them because for years they had been throwing away $30 per month in ignorance of what a Tubular would do for them, though the opportunity to try a Tubular in their own dairies was always open to them.

If you haven't a Tubular you can gain profitable knowledge by a test similar to above; and money profits twice a day after you put the Tubular in your dairy. Write for Catalog No. 260.

FREE TRIP TO SEE THIS HAY PRESS AT WORK

LOS ANGELES AND RETURN AT OUR EXPENSE

WE PAY YOU TO INSPECT THESE HAY PRESSES.

Instead of paying a salesman's fare to show you a small model of a hay press, we will pay your fare to Los Angeles and return, not exceeding $15.00, to examine our California Special New Century, full circle, all steel, self feed Hay Press and all others on sale there. It makes no difference which hay press you buy, we pay your railroad fare just the same.

When you see for yourself how this machine has been built expressly for heavy baling on the coast, how strong it is, how easy it is on horses, what smooth bales it turns out, you will understand why we make such an offer. It has 7-in step-over, pull power, high baling chamber, positive plunger rebound; it stands up to its work, no taking off of wheels. Has record of 39 tons per day. We will ship you one to try. If you don't want it we will pay freight both ways. Write now.

Scabs forming at the end of the teat are another source of annoyance. We have lost the use of the quarter in valuable cows in this way; every milking the scab must be picked off before the milk can be started the cow becomes hard to milk in that teat, milking tubes are resorted to and finally the quarter has to be dried off.

A year ago we had a cow's teat affected in this way. After trying every known method endeavoring to heal it and remembering what an old Scotch doctor used to say about poultices that heat and moisture was all the virtue they contained, we tried a small bread and milk poultice. At first we experienced some difficulty in keeping it on overnight. Especially was it difficult to tie a string without tying it too tight and stopping the circulation, but as a last resort I tried a rubber band such as is used on packets of letters. By using one large enough to double, it could be made to press on the teat in two places; in that way it did not need to be as tight to hold the poultice as though the pressure came in one place.

On taking it off to milk, no scab had formed, the milk came as free as ever it did, and in a week's time the teat had healed completely. The moisture by keeping the sore soft, prevented the scab from forming.

We have not had occasion to try this on sores or cracks on the side of teats, but shall on first occurence of such trouble and have no doubt it will work just admirably provided the sore is not so far up that a poultice will not cover it.

Perhaps one of the most common diseases of the udder is garget; various—are the causes—the thoughtless exposure of the animal to cold and wet, at the time or shortly after calving, the cow being in high condition; the hastily drying off of the cows, etc., but most commonly the trouble is caused by the careless habit of not milking the cow clean, but leaving a portion in the bag, and the best portion of the milk, too.

The cures are as various as the causes. As good and simple a cure as any, if the disease has not gone too far, is to milk out the rest of the udder clean; that is, if it has not affected all four quarters, which is, not common, bathe the affected part well with warm water, and let the calf suck and bunt the udder about at its pleasure; that is, if it is a new milk cow.

While it is generally considered bad practice to cut off the teat, there are instances where such treatment is not only beneficial but humane. A cow's bag is like a honey comb and should a tumor form and break it will only clean out the one cell; other tumors will form, break and continue thus for a long period. Should the teat be cut off, it will run out more readily, heal up quicker and cause less pain to the animal.

THE HOLSTEIN-FRIESIAN ASSOCIATION.

The twenty-third annual meeting of the Holstein-Friesian Association of America will be held at the New Court House, Syracuse, New York, on Wednesday, June 3, 1908, at 10 o'clock A. M., for the election of officers and the transaction of any other business which may legally come before it.

All persons interested in Holstein-Friesian cattle, whether members of the Association or not, are most cordially invited to attend this meeting.

, the orchard in question
ted for the 10 acres, 5000
dollars per year, is an ex-
y good one and has been
n a way to make it bring
the greatest returns. There have been instances of much more profitable orchards than that, at least more profitable for single seasons, but on these orchards there have been spent thousands of dollars in fertilizers and best of care. Such returns cannot be had until vast sums have been spent in putting them in proper condition to bear large crops of fine fruit.

Furniture Factories.

Will you please tell me if there are any factories in California manufacturing high grade furniture?—C. J. C., Sebastopol.

There are in Los Angeles several such, amongst which are the Wisconsin Furniture Company, Wicker Mfg. Company, Marshall, Stearns & Co., Bryant Upholstered Furniture Company. Of course, there are many such factories in San Francisco, but at this moment could not give their address.

Mange.

My horse has had a mange or scab about neck for about a year. Have tried various remedies, none effectual. —Subscriber, Laton.

Get the following and rub in once daily with small hand scrub brush. Soft soap, four parts; kerosene, one part, and to a quart add one ounce of eucamphol.

Wooly Aphis.

My apple trees had bunches all over them last year like cotton and when I broke them open I found they had little soft pink bugs inside. They caused the apple to drop off.—J. C., Riverside.

Your apple trees are affected with wooly aphis and should be sprayed with the rosin wash. It is made as follows and should be applied to the branches and roots: One pound caustic soda, six pounds rosin and 40 gallons of water. This is the proportion and may be made in amounts to suit. Boil together the soda and rosin for about three hours and add hot water occasionally to make the full amount. Never add cold water while it is cooking.

Potato Scab.

Please give me directions for dipping potatoes to cure scab.—J. B. Kelsey, Corona.

Soak your potatoes in a solution of corrosive sublimate in the proportion of one ounce to 15 gallons of water. Leave them in this solution for two hours. They may be left in the sacks while dipping. Dip before cutting for planting.

Irrigating Walnuts.

I note your valuable article in a recent Cultivator relative to grafting walnut trees. Thinking that your familiarity with the walnut tree would enable you to answer a question for me I ask, is there anytime during the year that walnut trees should not be watered if they are thirsty? What I mean is, will watering at certain periods cause the nuts to drop. My water supply is limited and when I water I make a basin around the tree about 15 feet in diameter and water heavy. Is once a month during the whole year too much? We have a deep, sandy subsoil.—E., Gardena.

If your trees have been kept well

watered so that the ground has been moist all the time there is no danger of the nuts dropping because they are irrigated. If the ground has been allowed to become dry at any time before the first of August, water might cause them to drop, but any dropping will likely be the effect of blight. Neither walnuts nor any otner tree should be allowed to become dry if they are to do their best.

If water is scarce it is better to use very deep furrows and water all the ground, if the trees are more than four years old.

Cover the furrows as soon as you can get a horse on the ground after the water has run.—J. B. Neff.

Eucalyptus.

I would be pleased to have you give me a treatise on growing blue gum eucalyptus from the seed in your valuable paper, which I have been taking for a number of years.—R. H., Modesto.

Eucalypts are not commonly propogated in open soil, but in seed boxes, and ordinarily they need some protection from cold and from the sun during their early stages. Most species make a slow growth at first, and are quite delicate, but when once fairly established they grow very rapidly. The seed is usually planted in August or September. From McClatchey's "Eucalypts" we quote:

The usual method of starting Eucalypts is to sow the seed in shallow boxes in especially prepared soil. A mixture of coarse sand and leafmold (two parts of mold to one of sand) is the best. This is placed in boxes a few inches deep; the seed is strewn quite thickly over the surface; a light covering of sand is placed on top, and this surface kept constantly moist. The plants commonly appear in c two weeks. After germinatio taken place the soil should b moist, but not wet. If kept too the young plants will be attacl parasitic fungi and perish ra "damp off," as gardeners t Applying the water about the of the forenoon, so that the plants have time to becom pa dry before night, is a precaut ful in preventing dampin of the experience of the writ th nothing better for freshly sown or for young plants, than a by a rainfall. Leaving the out during a light rain w start seed that artificial for weeks has failed to bring young plants are very much and invigorated by a shower

Before transplanting it harden the young plants by them only sufficient water wilting during the heat of After a week or so, when become more woody, wate applied freely for a few they will then be in a be tion for transplanting th treatment is omitted.

When the young seedling or three inches high, they transplanted into flats of f putting in the plants about apart each way. The soil tain less sand and more than the seedbed. A mixt mold, sand and some soil si that in which they are to b the field is a good combina the plants are few and cho usually best to transfer th the seedbed to pots inste flats. From the pots the transplanted with less loss t the boxes. They still need f watering, but the surface of does not need to be kept as during the earlier stages For a few days after being tra they often need additional from drying. When they come well established it is expose them to the sun and door air sufficiently to har before transplanting to the

hn Schilling, Jr., Davies Warehouse
ntral Ave., Los Angeles, Cal.

you advise? I understand that early rains would injure them. If so, what is the nature of injury, is it blight the same as potatoes? Please tell me just what risk I would run, or is there any other fall crop you would plant in preference, except potatoes?—Mrs. M. F., Anaheim.

Yes, plant by July 20 Lady Washington or small white navy bean. The injury from early rains is mildew or mould, but you can stack or guard against that. You may plant cabbage at any time. Beans would probably be more profitable. Potatoes on same ground would not be as desirable as some other crop. Of course, you must irrigate and have your ground in good condition.

Pop Corn.

Do suckers on pop corn help supply pollen or should they all be taken off, and is there any remedy to keep worms out of the ears?—W. W. K.

Suckers should be taken off from every kind of corn if the best development of ear is desired. Suckers supply no pollen unless they bloom, and if they do bloom it is at the expense of the main stock, which, if well developed, will afford abundant pollen. There is no practical way to keep out the worms on a large scale.—Q. A. L.

Trees on Line.

Will you kindly inform me, at your earliest opportunity, if there is any law to prevent my neighbor from planting eucalyptus trees on our division line. I have read your answers to inquirers about trees that are already planted, etc., but I want to try and stop my neighbor before he gets his young trees planted, as I think they will sap my land, as well as being unsightly, aud also if he puts up a fence, can he compel me to pay half the expense.—Subscriber.

There is none, though you may dig trench to any depth you wish along near your line to prevent roots encroaching on your land. You may also trim off branches projecting on your side of line. Should the trees shade your land so as to damage crops on your side of line, you have cause for action, and any damage you can prove gives cause for suit. He can not compel you to pay for line fence unless you use it.

Storing Potatoes.

Please tell me the best way to handle and store potatoes, a small quantity for long keeping. Is there any way of killing the eyes without injuring the potatoes?—L. N. S., Glendora.

Outside of cold storage, I know of no practical method of storing potatoes in this climate that will keep them for a long time. I gave up trying to accomplish this feat years since and aim now to grow about what we can use through the early summer and buy either second crop grown here or first crop grown in northern localities for our fall and winter supply.—Q. A. L.

Wire Worm.

Can you tell me what I have to do against a small worm (about 1 inch long and as thin as a pin, with a brown head), which is destroying my muskmelon plants?—R. A. K., Arroyo Grande.

This is doubtless the common wire worm, or larva of the click beetle; a perplexing pest and impossible to control satisfactorily. They require two or three years to mature and they destroy most grain crops, strawberries and a few other root crops. Rotating crops by planting something they will not eat and they starve out.

Blackberry Rust.

Will you please tell me through your paper what disease this is on Loganberries. Inclosed you will find a slip. —W. S., Glenn.

That is the common blackberry rust and cannot be controlled after it has possession of the plant as in this case. Remove and burn affected canes and another season spray with Bordeaux before it appears.

Classified Liners

Rates 1½ cents per word per issue. No ad accepted for less than 25 cents. Our classified columns are the clearing house for the readers of the Cultivator. Here you can insert an ad for the small sum of 1½ cents per word per issue, and be sure that it will be read by thousands.

SITUATION WANTED.

WANTED TO RUN THRESHER THIS season. State wages, number of days run. BOX 125, Beaumont, Cal.

ENTERPRISING MANUFACTURERS.

Thomas Kearns, well known as a successful mining operator in the southwest, recently organized a company to establish a modern pumping plant and electric light system in Rawhide, the new mining camp in Nevada, and has just placed an order with the Western Gas Engine Company of Los Angeles for a 180-horse power distillate engine, which will be used to furnish the motive power for the plant.

The above item is from a Los Angeles Daily and indicates the good work which is being done by the engine manufacturers on the Coast. Those particular engines are to be used to lift water from wells near the town of Rawhide and will pump the water several miles against a head of about 1400 feet.

Motive power for such work must be thoroughly reliable and able to stand up under strain and this engine was selected after thorough investigation by Mr. Kearns.

The investigation was made more thorough by the fact that the same concern has used a number of the Western Hoists and have found them exceptionally satisfactory.

THE CITY BOY.

God help the boy who never sees
The butterflies, the birds, the bees,
Nor hears the music of the breeze
When zephyrs soft are blowing;
Who cannot in sweet comfort lie
Where clover blooms are thick and high,
And hear the gentle murmur nigh
Of brooklets softly flowing.

God help the boy who does not know
Where all the woodland berries grow;
Who never sees the forest glow
When leaves are red and yellow;
Whose childish feet can never stray
Where Nature doth her charms display.
For such a hapless boy, I say,
God help the little fellow!

THE SCAPEGOATS.

Continued from last week.

In a private ward Mr. Carlton rose from a chair beside the bed on which his son lay and he bowed coldly to Riversley, while the nurse glided silently out of the room.

"Bob, old boy, here's Mr. Riversley come to see you," said Mr. Carlton gently, turning to his son.

As Bobby opened his eyes, an unwavering spirit was reflected in them. Riversley saw the look and bit his lip.

"I'm sorry, Bob—more sorry than I can say," he said, with a sad smile, leaning over the bed and lightly touching the boy's hand; and as he bent lower he whispered, "for heaven's sake, speak."

The boy rolled his head on the pillow to avert his face and closed his eyes.

"Bobby, haven't you got a word to say to me?" said Riversley, with infinite gentleness. "We were such good pals once! Won't you say something I can remember—something for friendship's sake, that'll make the world seem—what?"

Riversley saw Stella draw nearer to the bed. She was watching his face narrowly; he could feel her gaze.

"Go away!" whispered the boy, faintly.

Riversley swung around and something rising from his heart shook him.

"Bob," murmured Riversley, turning back to the bed, "I'm going now, old chap. Good-by—goodby."

Riversley squared his shoulders as he followed Mr. Carlton out of the room. The elder man inclined his head slowly and drew back, and Riversley went down the steps like a tired man.

Late in the evening he sauntered that way again and stood outside the hospital. Then he walked past a few hundred yards to where the road became a boulevard, with seats and trees. He sat down and watched the few passersby with the air of a stranger conscious of his lonliness. He vaguely noticed that one man passed and repassed two or three times on the opposite pavement asd finally crossed the road and sat down on a seat in the shadow cast by a tree.

Presently he became conscious of a light, quick step coming from the direction of the hospital, and looking up he saw the figure of a woman approaching him. He did not recognize her till she had almost passed, and then impulsively he rose.

"You?" she whispered, startled. "Oh! why are you sitting here?"

She drew nearer to him and he could see that one of her hands was pressed to her heart. He did not speak.

"Mr. Riversley," she said, stepping into a shadow, "do you know why I sent you away this morning?"

"No."

"I wanted to find out from Robert why you had come so far to see him; I saw a strange expression in face, and I heard your whispe him."

"I muttered to myself—I've g that way of late."

"You need not tell me, know, she said, in a fain voice. "I—I—I made him te and I think he was happier he told me; but I—I wouldn't when he died." She put and hid her face in t gently.

Riversley glanced this way and looked at her again. "Do said, huskily.

"But I—I—have kissed many, many times since, needn't have told me, need h

"No," he answered, "h have told you."

"Oh, yes," she exclaime her arms, "of course, he have told me—he ought to me months ago. It was him—wicked of you both ceive me. Oh—oh, Jim—"

"Hush—you forget!" sai ing a quick breath.

"Yes—I forget." She head and they stood sile face. "Jim," she cried, drawing near, "let me for She put her arms around "Only for a minute—forg minute; remember only our forgive me. Oh. Jim—J me!" She laid her face breast and wept.

"Stella," he said, in a l "we're in a public road. P pass! Child! Someone is Remember Rouston."

"Forgive!" she pleaded.

"I have nothing to forgive But remember Rouston."

"I remember," she answ ing back and dashing the t her eyes. "He should be was to have waited on the for me to see me to the came over from London after he heard the news."

"It was Rouston, then, I the road and sit down th ersley exclaimed.

He strode rapidly to the and a man rose up as he ap and held out a hand.

"Halloa, Riversley! What are you doing in Paris?"

The recognition was ous that it was clearly significance. Riversley h ulation asd gave no chanc

"How long have you b he asked.

"Oh, not long. Introduce the lady, will you—unless—I her?"

"Rouston! She is—"

"Stella? Of course! I kn I know, old chap! I'm not Good night."

"But, Rouston—"

"Hang it, man, won't y fied till I say I heard every I have always thought B by clear the air one day and t off? I couldn't hold her to it wouldn't if I could. Good n gl

He was gone.

Then Riversley returned slo where Stella was standing shadows.—C. Randolph Lichfi Tit-Bits.

PERSONAL NEATNESS CLUB.

THOSE who love fragrance should take advantage of the wealth of bloom during the summer months to garner a rich harvest. Ordinary manufactured odors can never take the place of the dainty fragrance from dried rose leaves, lavender and other sweet-smelling things. One may fill the house with "airy wafts of perfume sweet," if care is taken to gather materials when nature provides a bountiful supply.

* * *

Again an old friend comes with a suggestion for economy. "Economy" is a hard word to some. It suggests doing that which embitters and grinds. They get confused on economy and parsimony. Economy is only an "orderly system or regulating distribution." All must certainly—or should certainly—do that.

Surely if one doesn't there will be confusion somewhere.

Hence let us be orderly and economical and with it all cheery and happy, in that economy in our lives gives a greater happiness in another.

Millinery Economy.

Dainty and becoming hats need not be expensive ones as nearly any good straw hat can be brought up-to-date by changing the shape or style of trimming, and the brim can be made higher by ripping the crown apart and sewing in a band of buckrum of the desired width, and this band can easily be concealed by the trimming, and the brim can be made any width wanted by adding rows of fancy straw and this comes in every grade and color. Steel ornaments can be brightened by first cleaning them with sweet oil and fine pumice stone, using a small tooth brush for fine, cut work, then wash in hot suds and polish with a piece of soft flannel. A white straw hat that is only slightly soiled may be cleaned with moist cornmeal, and if very soiled it can be cleaned by brushing with a paste made of lemon juice and flowers of sulphur. Let the paste remain on the straw until it has become thoroughly dry, then brush it off with a clean, dry brush

Some faded red roses were made to look as nice as new by dipping them in dark red diamond dye for cotton, and some faded straw hats were renewed by dissolving some of the same dye for wool in a little alcohol and applying to the hat with a soft brush. The hats were bent into the desired shape and when perfectly dry, they were given a coat of thin varnish.

Boys' hats cleaned and freshened in this manner, and treated to a new lining and band of ribbon, will be given a new lease on life; if the straw is good, it is well worth the trouble, as it will save the dollar or more that such hats cost.

The roses are simply dipped and re-dipped in the dye until the right shade is obtained, then they are hung up by the stems and when partly dry, the petals are carefully picked apart and smoothed out with the fingers. Sometimes the addition of new leaves, which can be purchased for a trifle, will give the flowers a fresher appearance. Black or tan straw hats can be renewed by brushing them over once or twice with shoe polish, either black or tan as required.—A. M. H.

A farmer's business is to gain a little in the knowledge of farming each day.

CONGO

Congo roof on L. S. White Foundry,
Endicott, New York.

ROOFING

(Send for Free Sample.)

STUDY the subject of roofing. Send for catalogues; ask questions; investigate. We give you this advice because we feel sure that after you have looked into the matter thoroughly you will decide upon Congo.

Congo can stand the *minutest examination*. In fact, we urge this method for our own good as well as the customer's, because it increases trade and makes for us life long friends.

Congo deserves its leading position among ready roofings because it has all the qualifications needed in a durable, waterproof roof.

Congo not only is absolutely waterproof when laid, but it remains so for years.

If you have a leaky roof, you can appreciate how annoying and expensive it is. Congo avoids all this.

These are facts well worthy of consideration, and if you put up a new building, or if your old roof gives trouble, use Congo. Congo can be laid right over an old roof, and you can do it yourself. No special tools or skilled labor required. We supply nails and cement for laps.

Send for Booklet and Sample and see for yourself what a real "never leak" Roofing is like.

Hay.

Somers & Co. say:

Lack of development work throughout the State and a considerable falling off in business here will probably cause a decided decrease in the consumption of hay during the coming season. It is yet too early to forecast the crop with any certainty, but the recent showers combined with the prevailing cool weather throughout the Coast has helped the situation materially.

The account of stock in warehouses tributary to San Francisco has just been compiled by the San Francisco Hay Association, and we note a total of about 60,000 tons as compared with 40,000 ton last year. This item alone will help materially during the coming season for we have frequently noted stocks of from 15,000 t ton at this time of year.

Prices show no material chang those given last week, for al occasional sales are made at quotations, yet the average r about the same. We give prices as follows:

Choice wheat hay	17.0
Good wheat hay	14.00 t
Other grades same	11.50 t
Wheat and oat	12.5
Tame oat	11.5
Wild oat	10.0

Gold and Rigorous Cold to the North of Us; What Lies to the South?

"THE Indian reads his doom in the setting sun," were the prophetic words uttered by a noted Indian chieftain more than half a century ago.

The barriers placed by savage tribes have all been swept away, and the Pacific Coast is teeming with a people restless, energetic and full of plans for great achievements.

To the south of us lies that which will become one of the greatest countries on earth: very much of it today is virgin territory. This is not a new field to conquer in a hostile sense, for only peace and the best of good will exist between the two republics: between the northern born American and the Castilian dwelling in the land of the Montezumas. But Mexico has become progressive and welcomes Americans, with their vim and energy, their capital and their progressive ways, and will continue to welcome Americans as long as they continue by their methods to be a true acquisition to the country they are now assisting to develop.

In many ways, perhaps, the most highly favored portion of the great Republic is that portion comprising the States of Vera Cruz, San Luis Potosi, and Tamaulipas, with their sea-port town of Tampico, which is today the greatest seaport of Mexico, and is destined to be one of the busy marts of the world.

In July, 1905, the shipping of Tampico was cared for by nine lines of steamers, but today sixteen steamship lines radiate from this center to all parts of the world; yet, strange to say, the natural resources of these wonderful states have scarcely been touched: by far the greater part is either dense jungle on the rich river bottoms, or stock ranges on the higher plateaus.

The rivers Panuco and Tamesi are important streams, emptying into the Gulf of Mexico at Tampico. The Tamesi, at its junction with the Panuco, is as wide as the Mississippi is in many places, and will perhaps average 500 feet in width for more than 100 miles above its mouth. For large ships, one place on the Tamesi, near its mouth, needs dredging. This was temporarily dredged during the Mexican War, and the American fleet passed up the river to a point eighty miles above Hacienda Paso del Haba, or one-hundred fifty miles above Tampico. This illustrates the easy navigability of the river. For miles and miles this beautiful stream, with its fertile lands, is fringed with banana groves and sugar plantations. These belong to the natives. Their sugar plantations are of the crudest types and are operated with old-fashioned wooden roller mills, and very rude boiling vats, but so successful are they, that from them an enterprising American company took its cue, bought Hacienda Paso del Haba, an estate of over 9000 acres, and is rapidly converting this valuable property into a modern sugar plantation. The same transformation is going on on the river Panuco, where two wealthy American companies are growing sugar cane and producing sugar. There are already no less than seven large companies in the region tributary to Tampico, raising sugar cane. Some of them have their mills completed with the most modern machinery, capable of manufacturing the highest grade of refined sugar. Some of the newer plantations are in more of a formative stage, but all have reached the point of assured success. One of the newer companies is composed of millionaires who made their wealth in Louisiana. They are transforming their business to a great plantation they are building here and are abandoning their Louisiana plantations.

The thousands upon thousands of acres which these companies are converting into bonanza properties, modern sugar plantations, are the merest beginning of what will be accomplished in Mexico during the next few years. If wealth will make any country powerful, Mexico is destined to great power.

The reputed gold of Ophir has been almost forgotten since the American discoveries of gold in frozen Alaska. but it remains for tropical Mexico, with her fifty inches of rain-fall, her extensive river-bottoms, with soil of unknown depth, and other conditions that make her the most favored field on earth for growing sugar-cane, to literally fill her ships with gold from the production of this, the safest and most profitable agricultural crop in existence.

Is this a sudden awakening for the Mexico we have all known for so long a time? A feeling of sadness sometimes comes with too rude an awakening. Let us go back for a little while to our pleasant dreams, to the Mexico of other days.

We are again in Tampico. Our faithful mozo (servant) is at our side. We are observing the quaint customs in this old city that has struggled up through the uncertain conditions of a listless past. The vaqueros return from the cattle ranges and engage in their nightly revels. The guitar and dance halls are in evidence. Occasionally an American comes upon the scene. If a traveler, and he intends stopping in the Spanish portion of the town, his trunk, instead of weighting down an express wagon, is borne on the back of a peon, who makes of himself a veritable beast of burden.

This is modern Mexico. The present clasps hands with the medieval. Whatever way we turn we encounter the modern in touch with the dreamy past. Everywhere about us are evidences of a new growth—a new era—yea, a new world that is being created, and that creation is springing from the combined brain and brawn of American architects and builders who are building up permanent wealth for themselves and all who participate with them will partake of the glory of the greater Republic which is foreshadowed and will rise as a giant hitherto unknown, whose power has not heretofore been reckoned among the nations of the earth.

Of California capital invested in the above rich section of Mexico, Los Angeles claims the distinction of having one of the most progressive companies in the field, namely The Tampico Sugar Company, with offices on the fifth floor of the Union Trust Building.

This Company has large acreage under cultivation, and some about to come into bearing.

The pioneering of this concern in placing before local capital the vast opportunities of sugar plantation development in the Tampico section is now telling in the splendid preparation of their plantation to enjoy an early market.

HUMUS hardly requires defining to the Orange Grower. Where it is existent in the soil you will find a profitable grove. Is your land deficient in this essential—HUMUS? After constant and emphatic work we have secured better service on the part of the Railroads, both in the matter of delivery and in furnishing loading equipment. We now offer you SELECT STABLE MANURE in any quantity, with a guarantee of immediate and regular delivery.

The grade we have to load for you during this and next month is especially desirable. It is neither wet from rain nor bleached out by hot weather. Our price for the next few weeks is lowest quoted during the year.

wers for the Blue and the Gray

The Southern women will decorate the graves of the Union and Confederate soldiers this Memorial Day. The bouquets will be tied with blue and gray ribbons.—From Southern paper.

arlands and wreaths of flowers,
  Roses of white and red,
Tenderly a woman laid them
  On the graves of the unknown dead.
She knew not on which side they fought,
  For the past lives not today,
But with loving hands she tied each wreath
  With ribbons of blue and gray.

Softly the languid Southern breeze
  Kisses the long grave-grass,
And murmurs a requiem, sad and sweet,
  To the mourners as they pass;
Sad-faced women and white-haired men
  Whose loved ones fell in the fray,
Spread o'er the mounds their flowers tied
  With ribbons of blue and gray.

Many a soldier lies at rest
  In a grave unidentified;
They were the unknown heroes
  Who rushed to the front and died;
But it matters not on which side they fought—
  Forgotten the feud today,
As the graves are decked with flowers tied
  With ribbons of blue and gray.

'Twas years ago they fought and fell,
  The boys of the Gray and Blue.
Both died for what they deemed the right,
  All were heroes, stanch and true;
And as they sleep in their silent graves,
  In the North and the South today,
Let us strew the mounds with flowers tied
  With ribbons of blue and gray.

citrus industry has been similar to this.
edlings in early days were considered
ood fruit. They would endure much hard
In Old Mexico I saw oranges brought
and thirty miles in sacks on pack mules,
d up at railroad stations to be shipped like
s, yet they reached distant markets in fair condition. Many of our own seedlings will stand treatment that would ruin our improved varieties.

There are two ways by which we may ward off damage to our more delicate modern citrus product. We may breed out these delicate characteristics, securing varieties that would endure rough handling. While this would be at the expense of desirable qualities, had we no other recourse, it probably would be the wise thing to do.

Breeding to Conditions.

Prof. Hanson, that grand man of South Dakota, who is accomplishing such wonders for horticulture in that great Empire of the Northwest, is trying to secure a hardy apple that will endure the cold winters of that north country, by crossing delicate varieties with the unedible fruits of that region. Judging from what he has already accomplished, there is little doubt about his succeeding. But no one expects him to produce anything to take the place of the California Bellflower, or any other variety raised under favorable conditions, sought for by fruit lovers.

Some California growers have been a little nervous over the possible outcome of Dr. Weber's new variety of hardy orange that may be produced throughout the temperate regions. No doubt he has produced a wonderful new fruit, but it will never take the place of our California navel. Though this beautiful fruit of ours, raised perhaps under as ideal conditions as exist, is delicate and unfitted to stand hardship, we have now been shown how these desired qualities may be retained, and yet have the fruit placed in the distant markets in perfect condition.

Instead of trying to breed into our juicy tender fruit qualities to enable it to endure hardship, at the expense of those which give our oranges their highest value, our propagators may now turn their attention to adding other delicate characteristics of flavor and beauty with assurance that they need not prove a hindrance to their profitable marketing. This may not only be known as the Powell era in the history of the California orange industry because of the new money values his investigations have given our product, but because now we may turn our attention to adding new attractiveness to our already popular fruit.

Long Time Learning.

I don't know how the rest of you old orange producers feel about it, but I confess to a very shamed feeling when I think that after nearly twenty years of experience with, and somewhat careful study of this fruit, and in spite of the tremendous annual loss we were sustaining from decay all this time, I had not sense enough to find out that all we had to do to put our fruit into the markets without decay, with an aggregate saving of millions to our industry, was to prevent injury in handling. And now, I feel like trying to forget the humiliation by adding my mite towards inducing the industry as a whole, to effectively use the tremendously valuable facts the government had to come across the continent to show us.

Here is the finest orange picked from my little home grove, near a score of years ago, and here is a Florida Russet that I cut from the Florida tree two years ago, handling it somewhat carefully that I might get it home safely. The framework of these fruits being uninjured, all germs of disease were excluded, and they remained perfect till the juice gradually evaporated after long exposure. In this little nutshell is the whole secret of our fruit decay and its prevention.

Prompt Applications.

Perhaps in no instance has so marked practical results from scientific investigation been followed so quickly and generally by actual changes in methods in any great agricultural industry, as we already find in the handling of our California oranges since the results of Mr. Powell's investigations into the causes of their decay have been made known. The newly discovered factor in prolonging the life of an orange after it has been parted from the tree, has been so effectively demonstrated, as to command the attention of growers in all California orange sections, to such extent as to have already radically changed methods in harvesting the fruit and preparing it for market. New laws concerning the effect of temperature, have been so well determined, as to materially change methods in transportation, and more than a million dollars per annum is being saved to the industry by intelligent, careful handling.

It is a wonderful achievement for scientific research and of the prompt application of its results in practice. I am proud of our Department of Agriculture, and the trained young men it sends us to help us out of our serious difficulties. I am proud, too, of the few enterprising orange growers who so promptly and efficiently applied the new facts brought out by the scientists, and so quickly gave us practical object lessons demonstrating their value.

But, are we satisfied, even with these prompt and splendid results, though alone sufficient to mark an era in our industry? I confess for one, I am not. So long as there is careless picking in so many orchards—so long as we see so large a proportion of the oranges hauled from orchard to the packing house in the heat of the day, unprotected from the broiling sun and insinuating dust, in wagons without springs and otherwise utterly unfit for their transportation—so long as crude or complex machinery through which it is impossible for fruit to pass without mechanical injury, is found in so many of our packing houses —so long as packing houses attempt to handle twice the amount of fruit during the hurried part of the season their equipment is capable of—in short, so long as the daily reports show that one-third of the sales returns from practically the same grade of fruit, average net, to the grower more than 50 cents per box, than the average of the lower third of the aggregate with the highest prices uniformly going to those utilizing the careful methods most thoroughly, so long, the gospel of careful handling of our oranges should be preached by every one interested in the permanent welfare of our industry.

Depend On Each Other.

It is not worthy of any of us to say, or think unsaid: "I have learned how my fruit may be put into the market at a large increase of profit over old ways, and I am seeing to it that it is done. The other fellow must look out for himself. Whether he uses the improved methods does not interest me." It should interest every generous minded man connected with the industry, and induce him to join in every effort to secure general adoption of better methods.

Some of you may question if this can be done.

With the Citrus Growers

METHODS OF BUDDING OLD TREES.

IT requires some skill to rebud an old orange tree and carry it through the first year satisfactorily. If a good top is not secured the first time, by all means allow the suckers to grow all they will for the first year and bud into them either in the fall or early spring, but do not cut them back till the following spring. If from any cause and especially frost, a tree should lose its top and go through the winter without one, it will take years to recover, and it is doubtful if it ever does recover entirely. It is more often profitable to replant trees from the nursery.

There need be no difficulty in putting a new top on an old tree unless it is a Mediterranean Sweet. There are often failures with this variety though there need not be a large per cent if proper methods are employed. The first operation is to saw off all branches that are not to be utilized in making the new top. The cuts should be made just outside of the base of the branch at a point known as the collar. The cut surface should be painted over with wax at once. Removing the surplus branches directs the flow of sap to the remaining top and insures better results. The buds are put in at this time and the increased flow induces a rapid healing and a quick union.

There is some value in what is known as cured buds. These are buds cut and packed away in moist sand for a few weeks or days before using. The bud sticks should be kept in a cool place in sand barely moist so that the bark will not shrivel or gather moisture. This renders the buds slightly tough and a little dryer than the stock into which they are to be inserted. As a consequence, as soon as they come in contact with the flowing sap, they absorb it rapidly and a transmission of sap is at once established. The buds thus inserted should be wrapped immediately with waxed cloth torn in strips about three quarters of an inch wide and in convenient lengths. The best wrapping material is made from good sheeting cut in strips as wide as the length of the working material is long. Roll the pieces as tightly as possible, wrap snugly with twine so as to leave no spaces in the folds, Boil these in pure beeswax for half an hour or more and remove from the wax while it is boiling. The boiling wax penetrates the entire mass of cloth and closes all the pores in the material. They may be left rolled up till used.

Removing the Bands.

This is the first important operation after budding. Buds may appear to be healed over entirely at the end of four weeks, may appear perfectly green and healthy, and if the bands are removed, many may die. There is no set rule for time in removing the bands, but if the weather is very warm during the first four weeks after budding it is safe to take the bands off at the end of this time. If the spring has been cold with little active growing weather, six weeks is none too long to leave the bands on.

At the time the bands are removed, the tops should be sawed off about one and a half or two inches above the buds. The entire trunk should be whitewashed at once to prevent sunburn, and the ends of the stumps should be waxed at the same time. A good and economical wax for this purpose is made of 4 parts rosin, 2 parts beeswax and one part tallow, boiled together till well mixed. Apply to the cut surface with a brush, and in order to do this it is necessary to keep the wax almost hot.

Protection.

The above described method is entirely satisfactory where there will be no danger from frost killing the young tops. In such cases where the above method of topping is employed, it is necessary to protect the tops during the first winter with some covering.

A very successful method often used in frosty locations, is to girdle the branches just above the buds at the time of removing the bands and allow the tops to remain till the following spring. The buds will start just the same as though the tops were cut off, and the umbrella top afforded by the girdled branches will protect the young top beneath from the frost. This method has been practiced by Mr. Koethen, of Riverside, with good results.

When wrapping the tops is necessary, nothing is better than palm leaves with the stems nailed to the trunk or branches and the leaf part tied snugly around the new tops.

Pinching Back.

The buds will make a rank, sappy growth and should be pinched back when about a foot long. At this length they will branch and harden the fiber so that they will not break off so easily in high winds, and will also stand the frost better than if allowed to continue the succulent growth. About September they should have the tips pinched again to prevent any later growth. After the first year, the new tops should be trimmed at the end of the growing season so as to shape the top, cutting back to the main fork of the main branches any long, slender growth. This will give shape and strength to the new top. Never cut a branch off so as to leave a stub at the end, but cut back to the first fork and make a shorter limb or a spur the terminal. This refers to the second and succeeding years. The first summer after budding it is necessary to tip the ends of the rank growth.—J. W. Mills.

HANDLING OF CITRUS FRUITS.

Continued from Page 595.

Most certainly it can be done. The orange growers of California are an intelligent class of agriculturists. It is true these new laws, the value of which scientists have demonstrated, are applied with more difficulty by the small grower. But when it is shown that on a product of but a thousand boxes there may be an actual saving of from $250 to $500, he is going to find a way to secure it.

Most Inviting.

Besides this money view, I confess to some sentiment in this matter. The production of oranges in California, to my mind, offers the most inviting of all agricultural pursuits for an intelligent, cultivated people. That the 50,000 cars of this fruit per season to go from California orchards in the near future, may be produced under the management of a few great landed proprietors, because of their keen, far-sighted, prompt adoption of better methods, neglected by smaller growers, is not a pleasing thought to me.

I prefer to think of this great product that will soon be found on the table of the wealthy epicure of all nations, because of its qualities, and on the tables of the intelligent laborer in our own and other lands, because improved methods have insured a low cost of production, and safe carriage to all countries, coming from ten thousand California proprietors of small holdings with an intelligent, happy household connected with each.. This I believe to be quite possible, with all the advantages it would insure to the State as well as to the local communities and the individual. It is for this reason largely that I believe special effort, individual and associated, should be made to induce the average grower of today to promptly utilize the improved methods,, not only of production, but of handling our great orange product which scientific investigations are so clearly demonstrating to us.

s of turpentine, etc.

ile fully recognizing the im-
nce of adding humus to the soil,
e never planted a cover crop in
rove, for I am not satisfied that
a wise thing to do.

om watching my neighbors ex-
ent (often disastrously) with
crops, I am convinced that un-
the present method the practical
ulties often far outweigh the
etical advantages. And even the theory is wrong in several important respects. The proper conditions for cover cropping seem to be almost irreconcilable with our system of irrigation in a semi-tropical, semi-arid region.

A cover crop would be more desirable in summer than in winter, to shade the ground from the baking sun; but this is incompatible with irrigating and dust mulching. Plant your cover crop before the rains begin, and you must furrow out in case further irrigation is necessary. Then, if the grove is on a hillside, the rains may convert those furrows into gullies and grand canyons of the Colorado; also you lose much of the benefit of the winters rainfall, since you cannot keep the soil in a condition to receive and store it up. In this particular the cover crop often does more harm than good. Plant your cover crop after the rainy season has begun, and you will probably have to plow it under before it sufficiently matures to be of any material benefit or find yourself with the ground "frozen" hard because you waited for the "last rain" that failed to make its appearance.

It reminds me of a neighbor who, this spring when the rains ceased a month too soon, after disking, plowing and cussing his luxuriant cover crop, and then making futile attempts to irrigate and cultivate, finally raked the offending peas into piles and burned them. He rejoiced, however, to know that the "nodules" and "bacteria" were somewhere underground and doing their perfect work. As the soil had been upheaved into mighty clods that needed the services of a rock crusher, I doubt if those nodules repaid the loss of moisture and the strenuous toil they had entailed.

Cover crops of any kind are a nuisance in a lemon grove, and upright growing ones are not to be thought of.

Considering these and other grave objections to cover cropping in our semi-arid climate, I have preferred to enrich the soil with humus and nitrate by the simpler and more direct method of hauling 'em into the grove in a wagon. On the whole, I think it is also cheaper. In my neighbor's case, I don't think his soil needed nitrogen, anyway. It needs iron sulphate and lime; for it is wofully deficient in iron, an important element for citrus trees—and it contains soluble silicates, which "set" like cement when drying—a condition which lime would correct by rendering them insoluble.

I would suggest that the Cultivator establish a "soil-doctoring" department, in charge of a competent chemist, so that the orchardist could obtain, for a reasonable fee, an analysis telling him in plain language what his soil contains and what it lacks, with practical advice as to the best means for supplying the lacking elements—not the technical form of analysis, which is almost as unintelligible and useless to him as would be a papyrus covered with Egyptian hieroglyphics.—James M. Pryse, San Gabriel.

* * *

The true test of fertilizer is results, and the fruit which folows its application. One orchardist will follow one method and secure big crops which prove profitable. Another, under other soil conditions and in differ-

POTASH

POTASH

in the fertilizer in generous quantities makes heavy yields of clean and sound vegetables and fruits.

Strong and lusty plants resist the attacks of insects and germ pests.

Plenty of Potash in the fertilizer assures the best crops.

TREE TANGLEFOOT

A Sticky Preparation Applied Directly to the Bark of the Trees

Will not injure trees. A band 5 inches wide and 1-16-inch thick cannot be crossed by any climbing insect pest. Remains sticky five to ten times as long as any other known substance. You can test it at slight expense, as no apparatus is required. Used by the carload in New England against the Gypsy and Brown-Tail Moths. In California it preserves prune orchards from the Canker Worm Wherever the Gypsy or Brown-tail Moths, Tussock Moths fall or Spring Canker Worm or Web Worm appear TREE TANGLEFOOT is of great value, and should be used when the caterpillars begin to crawl while they are very young.

Price 25c per lb. Liberal discount on quantities. The only safe and effective banding preparation. Send for testimonials.

Tom Lewis' Fertilizer

My Fertilizer is lower in price than other fertilizers and guaranteed to give results. I have hundreds of testimonials. Send for circular and prices.

Tom Lewis, 1916-1918 10th St., Sacramento, Cal.

ent circumstances, follows an entirely different course and accomplishes equally as good results. This is no indication that either of the methods is the only one or even the best to be used, but they succeed, and if that succees is complete it is sufficient.

We believe the very cheapest method of improving the soil mechanically and chemically is by the use of cover crops. We believe it because hundreds of orchardists have proven it under practically all kinds of conditions. With it they are possibly applying some form of commercial fertilizer.

On the other hand, we give an example below of Mr. A. B. Cowgill of Redlands who secured very satisfactory results as shown by the figures which he gives as the result of several years application of stable manure supplemented with nitrate of soda. The figures given here are as they appear in a recent issue of the Redlands Facts. This will in a measure sustain the contention of the above article. Meantime careful orchardists may also go on making money by cover crops.

Of the thirty acres of bearing trees Mr. Cowgill has been paying more especial attention to a ten-acre piece which he calls the "Benson orchard" because he bought it of a man named Benson when he first came to Redlands. There are 992 trees, Washington navels, on the ten, and they were planted 16 years ago.

During the season 1901-02 Mr. Cowgill picked 2260 loose boxes of fruit and in the spring of 1902 put five pounds of commercial fertilizer to each tree.

The following year the crop increased to 3055 loose boxes, and in the spring the fertilizer was increased to 10 pounds per tree.

In 1903-04, a further increase to 4052 boxes was made. The fertilizer was again increased to 12 pounds per tree the following spring 1904.

Up to this time the orchard was picked as a whole, but in 1904-05 the east and west fives were kept separate when the picking was done, and beginning with this crop is the part of this article which will be of especial interest.

The east five acres produced 2346 loose boxes and the west five 2057, a total of 4403 for the 992 trees.

The twelve pounds of fertilizer was continued. The next season, 1905-06, the results did not show up so well, as the east five had only 1658 boxes, a decrease of 688 boxes. The west five also showed a falling off, 1157 boxes being the product, or 900 boxes less than the previous yield. The ten had 2815 boxes, as against 4403 the year before, a shortage of 1588 boxes.

With a decrease in the output of the ten of over 1500 boxes staring him in the face, Mr. Cowgill began to sit up and take notice, and so in the spring of 1906 he added three pounds of nitrate to the 12 pounds of commercial, and on the west five he put four cars of stable manure during the months of December, 1906 and January, 1907.

Last year the effect of this treatment began to show. The east five, which had been fertilized with the 12 pounds as formerly with the addition of three pounds of nitrate, did not respond to its food but went down to 1479 boxes, 179 less than the year before. But the west five responded liberally to the food product given it and the crop amounted to 2059 loose boxes. This showed a gain of 902 boxes, but as the east five had dropped off in product, the
the whole ten was 723 boxes.

Encouraged by the appear
his crop in the fall of 1906,
gill determined to keep up us
nure, and in November and
of that year put two cars of
on the west five, which the
fore had shown a gain of 90
by the application of four ca
on the east five braced up th
with four carloads. In the
spring, a year ago, he contin
use of the 12 pounds of com
and three pounds of nitrate, b
the stable manure did not con
of the elements required to pr
perfect orange.

The results of this
showed up prominently this
son. The west five, which bo
ily the year before and upon
only two cars of manure we
again showed an increase, 327
being picked, an increase
boxes, and the east five, wh
gone backward for two years
up astonishingly well with
to its credit, a distinct gain
boxes after its rest. The e
therefore, brought in 3321 box
than last year, 6859 in all,
is yet a crop of Valencia La
picked, estimated at 100 box

Last winter Mr. Cowgill
he had brought the place up
state of health, only used f
of manure on the whole ten
spring put on the commercial
trate as formerly, 12 and thr
respectively.

OYING THE BALANCE OF NATURE.

omond, in Santa Cruz county,
ring from an attack of small
locally known as Kangaroo
rats. It is stated that some time since a war was waged on the rattlesnakes of this section, until these were nearly exterminated. The rattlers preyed largely upon the rats, and now that their natural enemies have been destroyed, there is no check on the rats, and they have bred in alarming numbers and are feeding on the tender growth of the vines to the destruction of the grape crop, and the growers are at their wits' end to cope with them. Most people would rather have rats than rattlesnakes, but this illustrates a great truth in the natural world, that there is a perfect system of checks and if we interfere with this balance of nature we will make a mess of it. We have done this in many cases, and the work is still going on in the slaughter of our birds; in fact, the undue number of many of our worst pests is due to the fact that their feathered checks have been wantonly destroyed and they have been left to increase without check of any kind. All of our worst pests of the orchard and the farm are due to the fact that we have in some way disturbed this balance of nature, either by introducing new insects with plants or in other ways, without their natural enemies, or by destroying their natural enemies as we have done in the case of birds and reptiles. All our reptiles are beneficial. Snakes live largely upon destructive rodents. Lizards, frogs and toads are insictiverous and all should be protected. Even the rattler, aside from its dangerous habit of striking at our lives, is beneficial. However, we should not advocate the rattler for he is too dangerous to take any risks with and all the good he might do would not compensate for his destruction of human life.

MUST STILL FIGHT THE CODLING MOTH.

The parasite of the codling moth, which was introduced severai years ago, and from which so much was expected at the time, does not appear to have made good. There was no question as to the effectiveness of its work in confinement, where its food was provided for it, and no other than codling moth larvae was within reach, but in the orchard, where its food insect was not always available in quantity, it has not proven so effective. It is a fact that there are very few codling moths left in the orchard when the fruit has been gathered. The great mass of the worms go with the fruit to the packing houses, and it is here that the pest can be found in quantity in the pupae form, in which form they are attacked by the fly. It is not improbable that the new parasite is now firmly established here and that it will do some good, but we have got to keep to the old time system of spraying with some of the arsenites if we would have even a partial crop. The Calliephialtes messor may be of assistance in checking the codling moth, but we shall have to secure a more effective enemy for it before we can place our whole trust in it.

FAMILIES SUPPLIED.

"Ma!"

"Yes, dearest, what it it?"

"Did you get my baby sister at the grocery?"

"Of course not! Whatever put such an idea in your head?"

"It says on the grocer's wagon, 'Families supplied.' "

The Ornamental Garde

PREPARING SOIL AND TRANSPLANTING.

BECAUSE the flower garden occupies only a small amount of space, as a general thing, most amateurs belittle the importance of doing thorough work in it, and it receives only a fraction of the attention it ought to get, writes Eben E. Rexford in New York Tribune Farmer.

This is all wrong. Whether gardening is conducted on a small or an elaborate scale, it ought to be done well. It must be done well if success is to reward our efforts to grow vegetables or flowers in a satisfactory manner.

There is nothing difficult about gardening if one goes at it in a right manner. It is a perfectly simple process. The amateur wants to get the idea out of his mind that there is a "knack" about it. All there is to do is to prepare the soil for the reception of the seed or plant and see that it is kept in the proper condition for plant development during the season.

Most flower gardens are so small that spading will take the place of plowing in them. This is really the most satisfactory method of turning up and pulverizing the soil, for the employment of a horse always results in more or less injury to the sward about the garden, and often to the shrubs and hardy plants growing near it. A man can spade up as much ground in two hours as the average woman will be able to take care of. If the man doesn't happen to be available a boy can generally be hired to do the work for a small sum.

The soil should be turned over to the depth of six or eight inches. Aim to bring the lower soil to the surface and bury that which most likely has the seeds of many weeds in it.

When the beds are spaded up apply fertilizer liberally. This must not be construed to mean excessive fertilizing. Too much manure will result in a luxuriant growth of plant and a few flowers. What is meant by "liberal" fertilizing is a sufficient amount to bring about a vigorous, healthy plant growth. Soils vary in different parts of the country, and a fertilizer that does good work in one place may be comparatively worthless in some other locality. Here is where the value of advice from some one familiar with the soil in your locality comes in play. If such advice is not readily obtainable it will be safe to make use of bonemeal, as this fertilizer almost always brings about good results on nearly all kinds of soil. If your garden seems to be of ordinary richness a teacupful of bonemeal to a yard square of surface will be ample. If it is very poor use a teacupful and a half. Scatter this over the soil as turned up from the spade and then go to work with hoe and iron rake to make that soil as fine as possible. There is no danger of overdoing this part of the work.

I would not advise sowing seeds in the beds where plants are to blossom. I would make a bed for seedlings, from which they could be transplanted later on. This because such a bed need not occupy much room, as the seed can be sown in rows close together, and the work of weeding will be reduced to a minimum. Concentrate your attention on the seed bed, therefore, as long as possible, and thereby save a great deal of work for yourself. Transplant your seedlings when they have made a second or third pair of leaves. They will be large enough to work around out danger of unrooting them with weeds—a risk which one always when seed is sown directly in bed where the plants are to bloom it is often quite difficult to tell w is weed and which is not.

Transplanting should be do [illegible] cloudy day, if possible. If the we er is bright and warm, do yo [illegible] planting after sundown. Lift [illegible] lings with some earth a [illegible] their roots, and be careful [illegible] turb those roots as little as [illegible] Water them immediately aft [illegible] ing. If the next day is sunny [illegible] them. I make a good shade f [illegible] set plants in this way: Fro [illegible] brown paper I cut circular [illegible] or twelve inches across. Th [illegible] a cut from the other edge [illegible] cle to its center. I fold the p [illegible] itself where this cut is ma [illegible] a sort of umbrella, and in a through this fold I run a w [illegible] wire answers a double p [illegible] holds the paper in its umb [illegible] and it becomes a support [illegible] shade when the lower e [illegible] thrust into the ground clo [illegible] plant. It will be understood [illegible] fore, that this wire ought to [illegible] or fourteen inches long and it [illegible] be large enough to hold [illegible] rigidly in place. Such a shad [illegible] the sunshine away from the [illegible] and does not interfere with a [illegible] culation of air about it.

Most persons have a dis [illegible] pulling weeds by hand. N [illegible] work of this kind need be do [illegible] adays. There are several wee [illegible] ers on the market which simp [illegible] part of gardening wonderfully, [illegible] it expeditiously and really b [illegible] one can do it by hand. One [illegible] weeding hook or claw, cost [illegible] 15 cents, enables you to work [illegible] a plant without running any [illegible] uprooting or disturbing it, and [illegible] you can accomplish more in [illegible] than could be done in a day b [illegible] weeding. It not only clea [illegible] ground of weeds, but it stirs [illegible] to the depth of an inch or m [illegible] other weeders sold by florists [illegible] fications of this idea, and any [illegible] will be found satisfactory.

Weeding should be begun [illegible] If this is done you get the st [illegible] weeds, and you can keep [illegible] control with but little [illegible] if you let them get the [illegible] they will be quite likely to [illegible] for the remainder of the [illegible] member that flowers cannot [illegible] to satisfaction when weeds [illegible] lowed to dispute the ownershi [illegible] ritory with them. Weeds ar [illegible] sive, and they will have eve [illegible] their own way after a little [illegible] give them a chance. Keep t [illegible] developing seed this season, an [illegible] year there will be comparat [illegible] of them to fight; but allow [illegible] them to perfect seed, and th [illegible] will be well supplied with [illegible] have not advised the use of [illegible] manure simply because it is a sure to be filled with weed [illegible] making a good deal more work essary than when commercial izers are used.

Do not waste your time and on the making of "pattern" beds your beds be simple in shape, a pend on the flowers you grow in to make them attractive. An rately laid out bed may show its tern" at first, but as soon a plants in it have begun to spre outlines will be lost sight of, a one will know that there ever "pattern" to it.

The Vegetable Garden

EGG PLANT.

One of the really good vegetables that are rarely found in the average farmer's garden is egplant. Thinly sliced, dipped in an egg batter (or even without it) and fried brown in butter, it is a most delicious dish and takes the place of meat at many of our meals during August, September and October. This vegetable delights in very rich soil and in summer heat. No use planting it in poor or cold soil. Always plant it in the warmest and most fertile spot in the garden, and you will get plants that are productive of choice table material and an ornament to any garden. A well developed plant, laden with its large, glossy, purple eggs, bigger than ostrich eggs, possibly four to six in number at a time, is an interesting and attractive sight. The time to set the plants in open ground is about the same as for setting sweet potato plants. The ground must be warm and the weather settled. It is of all plants the one which the average farmer will find most difficult to raise. In most cases it would be the best plan to secure the plants from a seedsman or plantsman. You can probably get them from a gardener in the vicinity who raises vegetable plants for sale. A half dozen plants do not cost a fortune. In a small way—that is, within the demands of a retail trade—I find eggplants a very remunerative market garden crop. We usually get 5 cents apiece for the average sized eggs, or perhaps 10 cents for three, so that a single plant, occupying a space of two and one-half feet square or thereabouts, has often yielded us 50 cents and upwards during the season.—T. Grenier in New York Tribune Farmer.

GROWING POTATOES.

Potatoes are mere enlargements of underground stems, strengthened and thickened, in which starch is stored up in such proportion, according to the characteristics of the soil and climate to either assist in its fullest development or check its ability to collect and store up starch particles. Those enlargements are known to us as potato tubers. They are not formed on the roots of the plant as some think, because it has been proved beyond all doubt that the whole of the substance contained in a tuber is obtained direct from the plant itself. This is seen when a tuber is separated from a plant. It ceases growing at once, but will, in the course of time, send out buds which in turn send forth roots not to nourish the tuber it sprung from, but in order to produce others.

Not a Root.

An instance demonstrating the fact that the tubers are formed by the plant and not by the roots can sometimes be met with in a crop, when a plant for some reason, which up to the present has not been satisfactorily accounted for, has failed to form any tubers below the ground, but has, instead, borne them on the stems and laterals of the plant some distance from the level of the ground. Were they then belonging to the roots such a thing could never happen. Again, if a potato is carefully examined it will be seen that the only thing in the shape of a root is the stem that attaches it to the parent plant, or one sent out from it on which a second tuber is formed. In no case will it be found that any kind of rootlet exists on the tuber that would be able to obtain nourishment from the soil to increase its growth.

We have seen, then, that potatoes are formed by the plants, and that they may be formed above the ground as well as below. In this matter it is as well to consider that whenever tubers are formed above the ground, or even on the surface, the results are poor, miserable little specimens that are not worth the cost of harvesting.

Must Have Air.

While air and warmth are requisite, too much would be injurious. This is proved when a tuber is planted in close, stiff soil that neither air nor heat can penetrate. It will struggle until it reaches the surface, and only then will it commence to throw out laterals on which the tubers are formed. This being so, then it follows that the proper place for the others to grow, and where they will attain the greatest protection, is just below the surface. Having decided that first, potatoes are formed from the plants themselves and not the roots ;and, secondly, that they mature to greater perfection just below the surface than above it; we will now consider the subject of planting the sets, and for this purpose we will take two kinds of soil, stiff or heavy, and loose or light soil, at the same time bearing in mind the season we plant in, wet or dry.

Moisture.

While potatoes reqaire a fair amount of moisture, still, a very little in excess will either rot the tuber before it shoots or else kill the plant in its early stages. If, however, it survives and produces a crop, the tubers will be of such a kind that they will not keep any length of time after being dug, commencing, as a rule, to rot in a few days. This being so, it follows that in stiff or heavy soils devoid of drainage, planting should never be otherwise than shallow. When the ground is wet or likely to become so during the time of growth, three to four inches deep should be the maximum, earthing them up as they grow. When the time of planting is after the wet weather has ceased and there is but little rain expected, then the sets may be planted about five inches deep, every care being taken that the surface is worked into a fine tilth to a depth of at least three inches, so as to destroy all capillary action with the surface, and thus retain the moisture. —Western Journal of Agriculture.

POISONING GOPHERS.

Strychnine is the most deadly poison for gophers and similar pests. It is usually sold in small bottles which contain one-eighth of an ounce or enough of the drug to poison one quart of corn. Put the strychnine in a quart glass fruit jar and add a little vinegar and hot water to dissolve them, after which the jar may be filled with shelled corn and water sufficient to soak the grain. One or two kernels of the poisoned corn dropped into gopher holes will soon end the life history of the animal that eats it. Don't scatter the grain on the surface because the birds will get it and thus your best friends will be destroyed. Mark the jar with a poison label so that no accidents will occur.

It is estimated that Iowa will produce 400 million bushels of corn this year.

Hand Sprayers
FOR CONTROL OF
Blight, Rust, Etc.
FOR
Celery, Tomatoes,
Potatoes, Asparagus, Etc.
Specially fitted for spraying
2 to 5 rows at one time
15 to 25 acres easily covered

THE QUESTION OF FERTILIZATION.

On page 597 is a discussion of the fertilizer question which calls for a little comment, not to defend Mr. Palmer or Mr. Palmer's paper, for neither need it, but to induce all to read carefully any communication which will lead to a more intelligent view of soil conditions. Mr. Pryse, who writes the article referred to, criticises much of our literature on fertilization, claiming it to be impracticable. He wishes "something scientifically accurate and specifically workable." We believe that to be exactly what Mr. Palmer's paper is. He says he wearies of vague references to "Humus," "nitrogen" and "potash," etc. He says "humus is simply Latin for vegetable mold." Webster says it is soil from decaying vegetable matter. Either is good, but why not, when all understand the use of the word "humus" with its five letters, use it instead of the greater number which he might prefer. "Nitrogen, potash and phosphoric acid is the trinity which is essential to plant life." Therefore, discussion of them is eminently proper and we believe will lead to better understanding of requirement of trees and crops.

Mr. Pryse does not believe in cover crops, or at least is not convinced of their worth, and gives an incident where an unfortunate allowed his ground to become so hard that it was impossible to plow it under. This was a mistake and, of course, the fruit grower had to suffer for it. Those who believe in the cover crop say it should be plowed under by the last of January or the 1st of February. As this period was before the last very heavy rain there was no excuse whatever for any grower allowing a cover crop to remain until his ground hardened. For he could have even allowed the cover crop to remain unplowed until the end of February or the 1st of March of this year and still plowed under with the soil in fine condition.

The best argument of all, however, in favor of cover crops is the fact that many of the most successful orchardists in the State are finding that they are making them money. That is the best argument for any line of culture in orchard or field. Mr. Pryse is located at the gates of the city of Los Angeles where manure may be had for the asking, providing he will haul it away. A great number of the orange groves of the State are 60 or 70 miles away from a section where large quantities of stable manure are produced. It means shipment by freight, consequently high price for stable manure; yet, it is used by many with success as to net returns. The point we would make is, do not condemn what others are using to make the soil give forth abundant crops of fruit which bring great wealth, but proclaim what our own methods may accomplish which is the best argument.

Regarding the suggesstion that the Cultivator establish a "soil doctoring" department through which analysis of soils may be obtained for reasonable charges, we may say that the State University now gives an analysis of the soil of any orchards in the State without any fee. As soil analysis is quite an expensive proposition it would be impossible for the Cultivator to do it without some fee which would be needless to attempt in face of the free service now rendered by the State. Regarding discussion of these questions, we will be glad to have Mr. Pryse and others use the columns of the Cultivator in a way to bring out the truth.

NAME YOUR RANCH.

There is more than sentiment in having a name for the home ranch. We believe it gives a commercial value to a place and we are sure it adds to the pride and interest in a place to have it spoken of by some attractive name. For a family to refer back to its old "Wayside Home" where the children were born and where many happy days were spent, is always a pleasure and usually gives a name which stays by the place, and instead of its being dubbed "Jones' place" or "Brown's place" it has a name and character of its own.

We note exchanges in Washington speak of the custom becoming very common amongst many of the ranchers in that section, and we give herewith some of the names which have been applied to ranches. Should Cultivator readers have taken up this plan of naming the place and send to this office the name chosen for the ranch and the name of the owner we would like to make and publish a list that there may be as little duplication as possible. A name which is descriptive is always nice, but there are many others which give attractiveness to the farm. The names chosen by the Washington ranchers are as follows:

Cherry Hill, Fernwood Cabin, Garden Spot, Sylvan Lake, Cedar Creek Stock Farm, Blue Grouse Ranch, Green View Farm, Lorraine, Mountain Pass Ranch, Brookside, Fair View, Little Spokane, Hill Top Farm, Red Apple, Lake View, Ridgeway, Snowflake Farm, Sunny Crest, Shadydale, Mountain View, Echo Ranch, Woodland, Lone Maple, Spring Dale, Springland, Fairview Fruit Ranch, The Poplars, Valley Home, Castle Rock Farm, Canyondale, Cottage Grove, The Old Homestead, Melon Hill, Grand View Villa, Emerald, Latah Park Farm, Knob Hill Fruit Farm, Cloverdale Farm, Green Mountain Home, Sunnyside Farm, Mountain Lake, Cold Spring Ranch, Mountain Gem, Shadow Brook, Railroad View Farm, Cold Springs Ranch, Shady Lane Farm, Sandy Land Farm, Clover Vale Farm, Locust Grove, Elysian Homestead, Valley Ranch, Lone Poplar, Aspendale, Locust Grove, Big Flat Ranch, Rose Hill, Black Butte Farm, Sunny Point, Eureka, Travelers' Home, Mountain Home, Park View, Glendayle, Healing Oil, Lakeview Farm, Kootenai Ranch, Big Windy, Variety Ranch, Pioneer.

The press of the State has, as a rule, expressed pleasure that inasmuch as the Governor of this State could not attend the Governors' Congress called by President Roosevelt, the State was ably represented by Ex-Governor Pardee.

A NEW POULTRY WRITER.

The manner in which the business Cultivator is increasing is very gratifyin management and at the same time more perplexing to the heads of the various ments. It puts upon them questions of ment and an amount of work which is a capacity. The advertising department conducting of the poultry page of the Cu has in the past been in the hands of M Thomas. His larger work has been in th tising field and its increasing duties ha compelled the relinquishment of this depa He will, however, continue to contribute of special interest to fanciers.

The gentleman who will now take charg poultry department will be Dr. S. S. T for four years professor of agricultural ch and of stock raising at the San Luis Obis technic School. Prior to that time he w Purdue University, University of Arka the Utah Agricultural College. An ad drill which Dr. Twombly has had which in his work with Cultivator readers has work in the Farmer's Institutes of this These responsible positions certainly indi Twombly's capacity to furnish the C readers with the best of information in try industry and to answer such quest may be sent in along the lines of practic in the poultry yard and also the scienti tions which puzzle so many of our bes raisers.

FOOL HARDY.

It would naturally seem that the in the State of California to import anyth Florida would be Marysville, after its bitt ience of a year ago, when many of its tr almost wiped out of existence by the against the White Fly which had been in from Florida. It now seems that that c will prove very successful, and it is pos fly may be exterminated, but, in any case struction of beautiful shade trees and th the eradication both to the State and county has been immense. That campa made necessary by some one sending to for plants which brought the pests with

Now another lesson is wished by a ma ceived 1500 pineapple slips. They are re have been infested with some "obje bugs." Whether the bug was objection whether there were any bugs upon it is n tor in the case, for the State has a q against the introduction of any plant fr ida. Any one who will aid in the introd any plant from that State and jeopar greatest industry is either densely ignora a well-wisher of the State.

AN IMPORTANT MISSION.

It is impossible to predict the the trip of G. Harold Powell to Paris next ber. He goes as a representative of this the International Congress of the Ref Industries. This congress is called for pose of discussing various matters conn refrigeration and in connection with c cold storage warehouses, food products frigeration engineering It will be partic by all nations.

As said, it will be impossible to predic sult of Mr. Powell's trip, but from his gr in America in giving apple growers and growers points which have saved million lars to this country, we believe he will to give information even to Europe. Tr to gather in ideas which will be given when he returns.

ABOLISH THE RACE TRACK GAM

It was a stain upon the fair na State that for many years gambling mitted and even encouraged in connect the State Fair every fall. Fortunately been ended, and the State is now discu advisability of ending similar gambling which are in their season in full swing. tracks near San Francisco and Los These places have been the cause crime, even of murder, and to permit th tinuance in this State is a disgrace whic not be tolerated.

Agricultural Notes of the Pacific Coast

Northern California

Rice crop near Biggs is looking ell.

Newcastle cherry pickers are busy eople these days.

Sutter county will have an unusual op of peaches this season.

Cherry shipments are now moving rward with great rapidity.

Prunes in Napa county will be out three-fourths of a crop.

The cherry crop of the Sacrmento lley will be exceptionally good.

Fruit men are elated over the heavy op on the trees near Placerville.

Fire recently destroyed large raisin yer near Davis in Solano county.

Sacramento Valley alfalfa fields are tting heavy crops for first cuttings.

Woodland promises to harvest its ggest crop of fruit ever harvested.

Apples, plums, almonds and apri- ts will be a full crop in Napa coun-

Arrests have been made for cut- g irrigating ditches in Butte coun-

Almonds over the entire Sacramento lley promise an exceedingly heavy op.

Seven dollars per ton is being of- ed for alfalfa in the cock at Marys-

kiah Vineyard Association reports young vines as making a fine wth.

Apricots will be smaller than usual e, but the crop as a whole will be nense.

runes at Woodland are rather a rt crop, but apricots are excep- ially heavy.

pper Mattole had a rainfall to 1st of 78.67, which is 23 inches rt of last year.

alifornia Fruit Canners' Associa- will soon begin operations at its ta Rosa branch.

buyer is endeavoring to induce ners near Marysville to take up growing of flax.

uba City farmers find buyers for l rather scarce and have deferred l sales until June 6th.

noma county makes the boast that county never had, and does not l, a single irrigating ditch.

armers about Yuba City have l in that place 400 bales of wool, h are pooled in one bunch.

acer county creamery is making 500 pounds a day, as against ton a day earlier in the season.

e first arrest to be made under new State law compelling dip- of sheep was made at Cotton-

rndale has the contract to de- to the navy at Mare Island Navy on June 10th 100,000 pounds of r.

e Sacramento Valley Sugar pany at Hamilton City promises en up another tract of 5000 acres nd for settlement.

orough inspection of orange trees iba City is soon to be taken up to mine as to whether there are white fly there located.

owers which struck nearly all of acramento Valley last week did good to later sown crops and did damage to hay already cut.

Central California

Salinas has a rainfall record of 11.13 inches.

Cantaloupes are setting nicely near Turlock.

Lemons near Exeter are setting exceptionally heavy crop.

Prospects for a good fruit crop at Tulare are very flattering.

The Merced cannery, which is now building, is progressing favorably.

Never before has Tulare county been promised a greater fruit crop.

Four Armenians have leased land near Exeter on which they will grow tobacco.

It is predicted that about half of last year's prices will prevail for dried apricots.

Hanford fruit growers are studying the proposition for securing white labor in their orchards this summer.

Farmers in the Modesto irrigation district have experimented with growing grain under irrigation this season, with complete success.

Fruit growers of San Benito county have petitioned the Board of Supervisors to retain Horticultural Commissioner Day permanently.

The San Benito Advance says that the warm weather of the early spring followed by a cold spell destroyed the grasshopper eggs of the San Joaquin valley.

Orchard City Grange at Campbell, at its meeting recently, reported hay crops in fair condition. Prune crop almost a failure. Apricots about half a crop.

The swindling scheme has been unearthed by which a San Francisco concern has been disposing of a tract of worthless land in Tulare county to Eastern puhchasers.

Castorville has a new apple growers' company organized for the purpose of packing and shipping fruit of its members. The name of the company is Foothill Apple Growers' Packing House Company.

The Pajaronian says that packing house representatives are beginning to make accurate inspection of the apple orchards to ascertain the prospective yield of each orchard in order to be prepared to bid on fruit. No sales are yet reported.

Green fruit shipments last year, including apples and grapes, aggregate 7,000 cars, bringing a return of about $10,000,000, out of which the railroads kept $3,500,000. Predictions for this year's crop are that the aggregate will be about 10,000 cars.

The San Jose Grange reports that throughout the entire valley prunes will only be about 10 per cent of the full crop; apricots 75 per cent; Freestone peaches, 75 per cent; cling peaches, 45 per cent; apples 60 per cent; black cherries, 75 per cent and pears, 75 per cent.

At a meeting of the Executive Committee of the Central California Circuit of Agricultural Fairs, held in Fresno, it was decided that the entries to the fairs should close about the middle of June. The first fair will be held in Bakersfield beginning September 14th, the next at Tulare beginning September 21st, the next at Fresno beginning September 28th. the last at Hanford beginning October 7th.

Southern California

The hay harvest is in full swing in most sections.

The new lemon curing plant has been built at Corona.

Sugar campaign at the Oxnard Sugar factory, July 1st.

Orange output of Fullerton fell 100 cars short of last year.

Los Alamitos Sugar Company has nearly 8,000 acres planted to beets.

Alfalfa has been bringing $14 and $15 per ton in Southern California.

A bee ranch at Corona was badly scorched by field fires at Corona last week.

Riverside claims the highest price of the season on navels, securing $4.04 per box.

Irrigation is being practiced on some of the beets of the Los Alamitos Sugar Company.

Tomatoes which were planted on February 12th are now bearing finely in the Imperial Valley.

Earlier shipments of cantaloupes from Imperial Valley are now being made with regularity.

Grape growers near San Bernardino have organized for the protection of the interests of the growers.

Orange county chili growers have contracted for their crops for this year at $25.00 per green ton.

Shippers of cantaloupes in the Imperial valley have put forth a bunch of attractive labels this season.

Many cabbage growers in the neighborhood of Fullerton declare they will never grow another cabbage.

The California Vegetable Union has shipped 205 carloads of cabbages from Fullerton, Olive, La Habra and Brookhurst.

There will be nearly 60 acres planted to peanuts in Orange County this year. The revenue it is hoped will reach $30,000.

Santa Ana has a fine specimen of the Leu Leucadendron Argentuen or the famous silver tree of the Cape of Good Hope.

Castor beans have caused the death of one woman of Los Angeles and others have been seriously poisoned by eating them.

The big grain fields are not all wiped out in Southern California as is proved by the recent purchase of a combined harvester by an Orange county farmer.

The injunction which stopped the waste of water into the Salton Lake has been so modified that Imperial valley towns are now enabled to use their electric plants.

The old scheme of a California auction for oranges to be located at Colton is again talked of, the claim being put forth that California should be the greatest orange marketing center of the world.

The experiments with the long fiber Egyptian cotton, having proven so successful at Yuma, extensive plantings will be made at Coachella and Imperial valleys.

It is thought that the big Schiappa Pietra ranch in Ventura county will be subdivided and sold in parcels on account of the death of the former owner. The valuation of the ranch is $1,055,000.

The Coast

Eggs at Tacoma, Washington, are now selling at 20 cents.

First wool sold at Toppenish, Washington, was on May 19th.

North Yakima will ship 3000 carloads of green fruit this season.

Dry land alfalfa is becoming a feature of the great Inland Empire.

The prune crop of Oregon will be far below the average production.

Hood River section will market about 75,000 crates of strawberries.

There is much friction between stock men and rangers of the reserves in Colorado.

The first crate of strawberries shipped out of Washington sold at Olympia for $11.

The Swift Packing Company will erect a $3,000,000 packing plant at Portland, Oregon.

Kennewick, Washington, is calling for berry pickers to assist in gathering the immense crop.

A seven-acre farm near Milton, Oregon, recently sold for $7000. Land is not so cheap in Oregon.

Dry farmers at North Yakima found their later crops greatly benefited by a half-inch rain May 15th.

Farmers at Pullman, Washington, are delighted with the heavy rainfall which came on May 19th.

It is now claimed that Lewiston, Idaho, will ship more than 100 carloads of cherries this season.

Between 75 and 100 tons of wool will be sent out from the local warehouses of Toppenish, Washington.

Attacks of green aphis which were made on the orchards of North Yakima did much injury to fruits of all kinds.

Large numbers of Shorthorns and Herefords were recently sold at a thoroughbred stock sale in Portland, Oregon.

The membership of the Oregon State Grange is now 7009, divided up among 120 grangers located in twenty-one counties.

Prune growing districts about Salem, Oregon, have been seriously injured by late frosts, especially in low lands.

Frosts in Eastern Oregon did some damage to prunes, but did not injure young growing wheat as was at first anticipated.

Dairymen near Victor Point, Marion county, Oregon, recently held an enthusiastic meeting discussing the "$100 cow."

Rain in the Yakima valley aided very materially in the control of the woolly aphis, which was seriously affecting the apple orchard.

Over 20,000 acres of land is to be reclaimed by the Umatilla irrigation project in Oregon. The water will first flow over the land on May 27th.

The Oregon State Grange has passed a resolution favoring the principle of co-operation, also of consolidation of school district within the county.

The annual meeting of the Stevens County, Washington, Horticultural Association passed resolutions that the executive commitee meet in December and inaugurate a winter campaign of lectures and institutes.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

Browning of Ogden, Utah. Hens and Pullets, $15 and $30 per dozen.

MISSION VIEW POULTRY RANCH, MRS. C. D. HUBBARD, SAN FERNANDO, CAL.

Profit in the Poultry Ya

We solicit short articles of a practical nature from the fancier and u
breeder, giving their experience with poultry. All inquiries pertaining to
management, disease and its prevention will be answered through these col

BRAINS GOOD FOR POULTRY.

MANY people want to go into the poultry business simply for an occupation. As one remarked to us recently, "wanted something to do out of doors." When asked if he knew anything about poultry he admitted he did not, and further did not know whether he would like the business. Thought it was easy work with good pay and did not require much capital.

Now, here is what we consider a sure failure, we have seen it tried so often and almost every time with the same result. Not long ago we read a letter in one of our exchanges where some one was taking the poultry journals to task for misrepresenting the poultry business and only showing up the bright side. It said many were persuaded to go into the business on misrepresentations.

Now, let us get down to facts. How many people are there who would go into any business unless they knew something about it? To be sure the press gives the best side, but we don't believe they intend to misrepresent the industry. "The best" is possible to all.

If those going into the breeding of poultry will put the same amount of brains and energy in the breeding of poultry that would be required to make any business go these times, we know that they will succeed.

Love Them.

To make a success with any variety of thoroughbred poultry we should first have a love for the variety we choose. Then we should study the characteristics of the breed and the standard requirements. In this way we can learn what we want to produce and will know when we produce it.

That there is good money in poultry when properly managed is being demonstrated every day. It does not take an expert to see that the men or women that use brains in poultry are the ones who are producing the prize winners and getting business and profit.

* * *

AROUND THE YARDS.

Never stunt the laying hens.

* * *

Sow a small patch of rye or alfalfa now for green food.

* * *

Plenty of time to hatch yet if you failed to get as many as you want.

* * *

Oats is a good food for growing stock, but should not comprise the entire ration.

* * *

Don't let the lice worry the life out of the little fellows, and then complain of "bad luck."

* * *

Picking Each Other.

I have some incubator chicks that pick each others toes; anything that resembles blood drives them wild it seems; fed them meat but thought it made them worse. Will you kindly tell me the cause and what it is they require? It is the first time have ever had that trouble.—Mrs M. F., Anaheim.

The cause of the chicks picking each other is lack of animal food. Feed plenty of meat and beef scraps. It may be necessary to remove the worst from the brood as tl
very hard to break of the hab
once started, and care sho
taken to prevent rather than t
cure the habit.

Mongolian pheasants placed on a ich near Colusa are said to be incasing rapidly.

what had to be done to produce the Buff Orpington, Mr. Cook's perseverance and patience can well be appreciated. The Hamburg had blue legs, white ear lobes, and black tail; Dorking had black tail and five toes on each foot; Cochin had yellow legs with a lot of feathers on the same, and yet the perfect Buff Orpington has white or pinkish-colored legs, free from feathers and Buff color throughout.

It was in 1894, at the Dairy Show in England, that Mr. Cook first presented the Buff Orpington to the public. At this time he had about 2000 first-class specimens. All that he could sell were purchased at once, and orders for eggs were booked from the many thousand of others who wanted them. There is not the slightest doubt that if he had had 10,000 birds at that time, it would have been an easy matter to have sold them all. In the history of poultrydom the advance of the Buff Orpington stands absolutely alone, not another breed can begin to compare with it for popularity and usefulness. It will not be very long before there are more Buff Orpingtons bred in this country than any other breed. Single specimens have sold for $750, and quite a large number change hands at $500 each. It is very much easier to make money out of chickens in this country, since the arrival of the Buff Orpington. There is a ready market for good breeding stock at all times at good prices, also eggs for hatching. We do not know of an Orpington breeder who has been able to fill all his egg orders during the last season, the demand being much greater than the supply. We should strongly recommend all who keep the Buff Orpingtons, or who have any intention of keeping them, to join this club, as by doing so their knowledge will be much benefited, and if you are in the business it will help you.—Percy Cook, in Poultry Item.

A. P. A. ELECTION.

At the annual meeting of the American Poultry Association the officers elected were as follows: President, Chas. M. Bryant; first vice-president, H. B. Donovans; second vice-president, Miller Purvis; secy.-treas., Ross C. H. Hallock; Members of executive board: George S. Barnes, Reese V. Hicks, T. F. McGrew. Here is a good set of officers as any association could ask for, and one that we believe will do good work for the association. We never saw so much mud throwing as was done by the opposition to the election of Mr. Hallock to succeed himself to the office of secretary-treasurer. Mr. Rankin conducted the fight against Mr. Hallock and brought the White Wyandotte Club into the row and tried to line up every poultry journal in the country. This paper got enough matter from him to half fill one issue, which we consigned to the waste basket.

PACIFIC CORNISH FOWL CLUB.

A meeting of the Pacific Cornish Fowl Club was held Wednesday night April 29th, 1908, at the office of its President, Capt. T. H. Broadhead. After reading the minutes of last meeting and roll call, a very interesting discussion took place. The report of the secretary-treasurer showed a very healthy condition of club affairs. All bills paid and a balance of cash and stationary on hand to the value of $35.00. New members are coming in fast and the outlook is favorable for a membership of 100 in the near future. Twenty-five new members were elected.—John D. Mercer, sec'y.

INCUBATORS at COST

We Are Overstocked on "Old Trusty"

Incubators. We are going to sell them at cost just as long as they last. We have about sixty machines, all sizes. We do not want to have to carry these machines over until next Fall. We want to get our money out of them quick. The price we will make is the absolute cost of these machines and not a cent profit. Buy them as long as they last at the prices below. We can sell these sixty machines inside of ten days at these prices. Buy today—send your order direct. One hatch will pay for these machines. These Old Trusty Incubators are all hot water incubators heated by a system of genuine 12-oz. cold rolled copper pipes, which will last a lifetime. The very best safety lamp, the very best Sheer patent regulators, deep four-inch removable nursery drawers and all modern conveniences with every machine. First grade tongue and grooved redwood, double walls, double top and bottom. All we want is to get our money back and first come first served at these prices. I don't care if you buy a carload of Old Trusty Incubators you can't beat this price. We paid spot cash for 660 Old Trusty Incubators, and that's why we can make the low prices. Times have not been as good as usual, and we need the money and must get it. Now is the time to get a machine lower than you will be able to do again. Same big reduction on the brooders, 25 of them as long as they last. No incubator company on earth can duplicate these prices. Try to get them to do so, and see.

HORSE RAISING.

MATE up the young colts when first broken and keep them together at work. The stride then becomes alike and the team pulls together. The stepping together of a pair of horses comes easily to them if they are constantly driven or worked together. The load moves easier than where horses are mixing their strides. Carriage horses swinging along at the same step make the roads seem smoother, as the ruts and bumps are taken together and the carriage is borne along with slight jolts as the even pulling lifts it from the ruts. Change one of the horses for another and the same carriage and the same road will be found full of bumps.

Harness Styles.

The harness of many horses is incorrect from a point of easy work and of good taste. Now, take the breast strap harness or Dutch collar; these belong to the light buggy not to the surry carrying three or four people. The horse works to a great disadvantage in drawing a load on the narrow single strap instead of on the collar, where his strength is evenly expended. Really, I think that the breast strap, unless it is the very wide one that is in use in foreign countries is on a horse drawing a load, a real cruelty. It is one usually perpetrated on the gentle family plug. Then on the family surrey horse we often see the over-draw check used. This makes a ridiculous hitching up to any one that has had any ideas of style in turnouts. The absurd look of a horse in a heavy rig with his nose sticking straight out in the air, and his hind legs sprawled out to relieve the strain as he stands. It is like a bare necked woman with a diamond necklace and a calico dress skirt and brogans.

Check or Bearing Reins.

While many people advocate the entire removal of this part of the harness, the majority of horses are best driven with a loose check line. The horses that are not very sure footed are apt to slip around more and it is harder on the driver too, carrying their head on the reins all the while. Then, in California particularly, we decorate beautifully our parking with grass and flowers. A few horses without check reins would soon spoil these jewel-like settings of the bald gray pavements. The overcheck belongs to the track horse and very light road wagon. Surry, phaeton and heavy buggy should have the side check reins only. The breast strap, also, belongs to the light rig only. Remember, that correct style is as important for your carriage as for yourself. Silver mountings are in better taste than gold on harness for the family pair of horses. The carriage horse, with side checks holds his chin down and under, putting a bow into his neck. He can see his own front feet if he desires to do so. This is a different position from the overdraw rein, with the straight neck, nose straight out and the front feet as the horse moves apparently dangling. In this ungainly position he starts off with a shambling fox walk, you have the ungainly picture completed. Look at the carriage horse; the head is up, nose under and off he walks, front feet up with knees lifted, well flexed pastern joints; hocks coming up in well rounded action. The front action square and true with the knees rolling the feet out straight ahead, hind legs and front legs rolling and unrolling in rythmetrical precision. From the walk the gait quickens into a smooth trot, clean and true. Hind legs following squarely behind the front ones. So he moves on in stately fashion full of dignity and pride.

Blinders.

The lazy horse without blinders watches for the hand that reaches for the whip. The high mettle one may become a side puller as he tries to escape from the whip. Side pulling is regarded by many horse men as caused by the open blinds. Like tongue lolling it is a hard vice to correct once a horse has learned it.

As a matter of convenience, every horse should be carefully saddle broken. Many may never be ridden yet it is easier to handle horses that will carry weight on their backs if it is needful. After the colt has been well trained into his harness work, saddle him up. After he has become steady under the saddle, with an ordinary straight rein and snaffle bit, and cross the reins under his chin and make him bridle wise. When this lesson is learned perfectly then put on the regular Spanish bits and the horse will rarely learn to buck. Gentle manners in the trainer, like good manners everywhere, are quickly reflected in the horse that he handles. It is one of the things that makes good manners weigh heavily as an investment. Even the animals give us back the same as we give them.

Saddle Horse.

The Bible describes the war horse fittingly, yet who has even described the pleasure that a good intelligent saddle horse gives his rider? I have felt I was fortunate in being brought up from a child in company with a good saddle horse. The lessons in courage and self reliance that a horse teaches a child, are valuable all its after life. A dog may be a good companion for a child, yet not the equal of a horse. It is in these things that the country child is more fortunate than the child of the city. At the little district school house I see the children starting home on their ponies, ten or twelve in a bunch. They are a hardy, happy lot as they go racing off on the little wooly shetlands. These are not wealthy families; only vineyard folks. Yet a pony or two does not matter much in the stable. The luxuries of wealth are within the hands of the country dwellers when they know how to grasp and enjoy them.—M. E. Sherman.

RAISING THE CALVES.

The only argument in favor of taking the calf away as soon as practicable after birth and before it nurses is that if taken away then the calf can be taught to drink more readily than after it has had an opportunity to get its nourishment for a time by nursing from the udder. It is also thought by some that the cow gives up her calf at once with less grief than where she has been permitted to enjoy it for a day or so. The writer leans to the former method of management. Even though it means more work for the attendant, it is

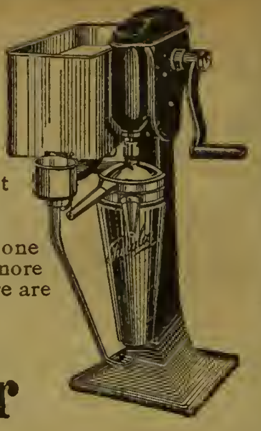
The Greatest in the World

Are you attracted by big buildings and a vast throng of busy workmen?
Stands for something, don't it?
No separator factory in the world is so big as the one where the Tubular is made; there are no employes more skillful than those who build the Tubular; nowhere are there so many people making separators.
More than one complete



Tubular Separator

in every three minutes, is turned out from our West Chester factory alone. We own another complete factory at Harburg, Germany, from which we supply the European trade. Another factory at Toronto, makes the machines for Canadian dairymen. Bigness alone don't make the finest separator in the world, but the finest separator in the world made the bigness and number of factories, and made it necessary to have the vast number of workmen. If you haven't one of the world's best separators you are losing dairy money.
Let us tell you more. Write for Catalog No. 260.

Water Tank

better for the calf. It is possible that a compromise method advocated by some is better than either mentioned. This method is to allow the calf to nurse once and then remove from the cow. In either instance, the calf must receive the first milk of the dam. It is well to let the calf get hungry after first removing from the pail. If the calf is strong a fast of 24 hours will bring the desired appetite. The calf should be fed whole milk for the first three or four weeks, two or three times a day. If a large calf, two quarts in the morning and evening and one at noon should be fed; a small calf should have only three pints in the morning and three pints in the evening and a quart at noon. It is better to feed milk immediately after being drawn from the cow. At the end of the third or fourth week the substitution of skim milk may be begun, as also feeding twice instead of three times a day. This should be brought about very gradually.

The first time any substitution of skim milk for whole milk is made, let one-half pint of skimmilk replace an equal amount of whole milk. The next time feed a pint, and so on, making a half-pint additional substitution with each feed. By following this method from 10 days to two weeks will be required to get the calf safely accustomed to skim milk. A teaspoonful of ground flax mixed in the skim milk is excellent. If any tendency to scour occurs, a small amount of blood flour mixed in the milk will check it. After the change has been effected the skim milk and the ground flax may be very gradually increased until at the age of four months the calf should receive a heaping tablespoonful of flax and meal and five quarts of milk twice each day. Do not forget that 10 to 12 quarts of skim milk per day is a full feed for a calf 5 or 6 months of age. When the calf is 3 or 4 weeks old it should have an opportunity to learn to eat oats, bran and corn. Professor Shaw, of Michigan, recommends the following mixture for this purpose: Corn meal three parts, oats three parts, and bran one part, by weight. One part oil meal should be added to this if no ground flax is fed as suggested above. The calves may be induced to eat this mixture by dropping a tablespoonful of it into the pail after the milk is gone. Do not sicken them by feeding too liberally.

They should also be encouraged to take a little silage and nicely-cured clover or alfalfa hay. As to the amount of concentrates fed, Professor Shaw says: "In general, about three-fourths pound concentrates per 100 pounds live weight, varying some, of course, with individuals." As a general practice, we strongly advise against mixing grain with skim milk for calf feeding. They should be fed separate as advised, with the possible exception of the small amount of flax meal mentioned. One essential point in calf rearing is frequently overlooked—namely, the supplying of an ample quantity of fresh, clean water, within the reach of the calves at all times. Some use a hog-waterer for this purpose.—Professor H. W. Mumford, in Beef Production.

We may not be able to prevent our cows from being lightning struck, but we can prevent their being sun struck.

COST OF BUILDING A CREAMERY.

ing the past few years there been built in the United States al thousand creameries, many of have been successful from the while others have failed after a ionths' operation, and some were even started.

investigation of the creamery ss in several States by the l States Department of Agricul-as shown that the cause of of the failures was due to lack ufficient number of cows, which l not be less than 400, and that failed because of improper or-tion, in the case of co-operative eries and excessive cost of ig. Many creameries have cost twice their actual worth, and not of the type suited to the lo-In which they were built.

cost of a building about 28x t will vary from $800 to $1400, lent upon the locality, the con-on and the cost of material bor. Such a building usually ts of a main work room, engine oiler room (including space for rator machine,) coal room, re-tor, storeroom and office.

hinery for a hand-separator consisting of 15-horsepower 10-horsepower engine, combi-churn with a capacity of 600 of butter, and other necessary tus, will cost approximately Machinery for a whole-milk will cost about $1850. This ient will handle from 1000 to ounds of butter per day. If a rating machine is included the ill be from $600 to $1000 more. total cost of a creamery would, re, vary from $2000 for a sim-id-separator plant without arti-efrigeration, where labor and il are cheap, to $4250 for a nilk plant including artificial ation and a higher cost of nd material.

Department of Agriculture is d to furnish information for per organization of creameries eese factories, and upon re-vill supply plan of organiza-st of machinery and plan for ry. Correspondence should be ed to the Dairy Division, States Department of Agricul-ashington, D. C.

COST OF SILOING.

es have been gathered by the ent of Agriculture from about is with reference to the time or consumed in putting up si-d the cost per ton. In estimat-cost of filling a silo a rate of s an hour was made for men same for a team of horses. hire was rated at $4.50 per luding the engineer, twine at ats a pound, coal at $5 a ton, oline at 13 cents a gallon. Ten ere considered a day's work. st of silage storage, as deter-y this investigation, varied to 86 cents on the various The average yield per acre tons, and the average cost per ilage 64 cents.

NEW CENTURY
PULL POWER NO PLUNGER TO BREAK.
7-inch Step-Over.
Tying chamber 18 inches off ground.
Stands up to its work, no taking off wheels.

Rebuilt New Century Hay Press WITH OUR IMPROVEMENTS IT IS THE STRONGEST PRESS ON EARTH. ALL IRON AND STEEL

We have rebuilt these presses and have taken advantage of two years' experience with all kinds of hay and can recommend and guarantee the press as it stands. These presses are 100 per cent better than the press as received from the factory and have our personal guarantee for the season. Sold on easy payments. A special bargain in a rebuilt second-hand press.
We carry the Pacific Implement Co.'s line of Buggies and Wagons and will be pleased to send Catalogue and prices.

CAPITO CARRIAGE CO., 12th and Main Sts., Los Angeles, Cal.

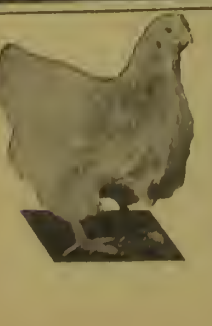
FREE TRIP TO SEE THIS HAY PRESS AT WORK

LOS ANGELES AND RETURN AT OUR EXPENSE

WE PAY YOU TO INSPECT THESE HAY PRESSES.

Instead of paying a salesman's fare to show you a small model of a hay press, we will pay your fare to Los Angeles and return, not exceeding $15.00, to examine our California Special New Century, full circle, all steel, self feed Hay Press and all others on sale there. It makes no difference which hay press you buy, we pay your railroad fare just the same.
When you see for yourself how this machine has been built expressly for heavy baling on the coast, how strong it is, how easy it is on horses, what smooth bales it turns out, you will understand why we make such an offer. It has 7-in step-over, pull power, high baling chamber, positive plunger rebound; it stands up to its work, no taking off of wheels. Has record of 39 tons per day. We will ship you one to try. If you don't want it we will pay freight both ways. Write now.

ARNOTT & CO., 118 South Los Angeles St., LOS ANGELES, CALIF.



MY BOSS MAKES MONEY

Because he raises poultry in the Inglewood Poultry Colony. Eggs bring a higher price there than they do anywhere else. If you are going into the poultry business, go in right and get a farm in the Inglewood Poultry Colony. Address for particulars

Inglewood Water Company

Queries and Replie

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Peach Troubles.

I have a few hundred cling peaches. Trees one year old. Some of the trees look like they are dying. They are well cared for and have been irrigated. The leaves lok greasy and dead. I have found ants both red and black ones on the trees, but no other insects. I would like to know if ants cause the trouble; if so, how can I get rid of them?—W. F. R., Orosi.

The ants are not doing you any injury, but their presence indicates that there may be some sort of aphis working on your trees. I do not understand why they should look greasy and dead unless they are covered with honeydew or gum. The greasy appearance would indicate the former and aphis would cause that. If you will mail a branch to the Riverside Experiment Station, we can perhaps diagnose your case.—J. W. M.

Planting Strawberries.

Tell me if it is to our advantage to plant strawberries this early if my plants are large enough. Which is best way to water same? My land slopes to south and falls about two inches to every 16 feet. Is it advisable to run small stream between rows and let it subirrigate? My soil is black loam, not 'dobe and it seems to soak well by running stream.—M., Arroyo Grande.

It will depend somewhat on how low the temperature falls in your locality. If practically frostless so that the plants will grow more or less all winter, you will get a much larger crop of berries next season than if you waited until spring. But it costs a good deal to care for the plants all winter and after trying all methods and seasons we believe to plant out about February 1st will give the best results, all things considered. In your case we should plant the rows north and south, 20 inches apart and irrigate from a flume with galvanized gates so that you can have the water under absolute control. On a grade so steep as one inch to eight feet you would have to allow but a light stream to run in order to avoid washing and cutting the soil. Do not make your runs too long. Allow one stream in every space. If your land is 200 feet long better make two runs of it instead of one; that is, have a second flume 100 feet distant from the first one.—Q. A. L.

Garlic.

How can I grow garlic? Is it as easily grown from the seed as from the bulblets? When should seed be planted and are the young plants reset? If only reproduced from bulbs, how far apart to transplant?—J. G. Baum, Olive.

Garlic is of easist culture, growing freely on any soil suitable for onions. Invariabily propagated by divisions of the bulbs called "cloves" or "sets." In California plant from September to February 1st, in rows one foot apart and four to six inches apart in the rows. Crop is harvested like onions and except in a small way always sold in the dry state. Sets can be had of seedsmen at about 15 cents per pound.—Q. A. L.

Spraying for Blight.

How can I secure the best results in spraying strawberries, and how soon after planting should it be done? The same with potatoes and tomatoes. What is the value of raisins sound, but small, for poultry?—Inquirer, La Mesa.

We do not understand what you wish to spray for on the strawberries so ask for further particulars.

As to tomatoes and potatoes, we assume you mean for blight. They should be sprayed with the Bordeaux at any time now, but would advise fuller particulars that you write Director Experiment Station Be ley, Cal., for Prof. R. E. Smith's letin on "Tomato Blight." It will fullest particulars.

We are not posted on the valu raisins, and any poultryman tried it will confer a favor b gi their results.

For Mehring Foot-Power Milking Machines see O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles, Cal.

Plant Oranges in Nursery.

Kindly tell me through t q column when to plant orang lings from the seed bed. Do leaves need to be stripped and cut off?—W. B. R., Holtville.

Plants should be taken fr seed bed at once and placed in nursery row. In fact, the u perience is that March, April an are the best months for trausp They may be planted later, h but as the heat increases great is necessary. This, we think, be especially true in your s Thoroughly wet the bed in wh have been growing; soften after which a spading fork ma used to loosen the soil. Th may be lifted so as to save a fibrous roots. Grade the plants to bring the same size togethe as possible. The extra small may be put back into another desired till next year, as they m cared for in that way much than in the longer nursery row not allow the roots to become to the wind or sun more than a ly necessary. The tip of the ta may well be cut off so that planted the tap will be p straight in the soil. Do not leaves.

Acacia Cyanophylla.

Will you please tell me w acacia cyanophylla can be grow itably on $100 land? It has ple artesian water, and is very soil. I am told that it would b $25 per acre per year for lan Will the tree put forth anothe from the stump?—J. H. S., l ton Beach.

We are unable to answer this tion explicitly, but from some we think it would be doubtful paying on $100 per acre land ever, it is worth investigation. subscriber will confer a favor ing us. The tree will not gr the stump after cutting.

Wood for Walnut Grafting.

Kindly explain this parag your paper of April 30th. Th graph reads "scions should alw of solid, mature, wood; that as small pith as can be had and they must have good, livi Should these scions be of last growth?—Subscriber, Arroyo

Some growers prefer the l son's growth, others insist u being two years old, while o indiscriminately of both, so other condition of small plump bud exist. From th sume there is but slight di

Stacking for Baling.

Which is the best method o oat hay for baling? Is it stock if allowed to sweat in for six or eight weeks?

Is it advisable to put fresh on walnut orchards in the That is, to clean it once a ing in.—S. W., Carpenteri

The nutriment contained is not changed by the sweating stack, but the hay is soften made somewhat more accep stock. It costs about $1.00 p more if it is stacked, and u command that much additiona market. This is largely on a of its being cleaner, as in the of stacking it loses boulders an and dirt which are often foun

when it is bucked directly to the baler.

A great many now advocate putting the fresh manure on the orchard direct from the stables, and disking in soon or when convenient, some even allow it to lie on the surface as a mulch. Of course, when this is done a great deal of its value is lost through its burning out under the hot sun. But in doing so it protects the soil to that extent that it may be advisable. Of course, if it is disked and the soil kept moist then it is practically all saved.

Imperial Valley.

Is there good soil in the Imperial valley for grapes? Do you consider that locality well situated as regards climate for grape culture? Has the Department of Agriculture bulletins on the grape culture of California?—E. H. G., Uplands.

The Imperial soil is good grape land. The soil of California generally is very mixed in character; while one piece may be good the next may be inferior. In buying a piece of land it should be examined for depth and for fertility. I think from driving around the town of Imperial that the soil is excellent. I saw young grape vines that were promising well. The climate that perfects grapes is necessarily hot. The Department of Agriculture has not much on the grapes we cultivate, the European varieties or Vinifera, the bulletins dealing with the Eastern or vitis forms. These are now used to form rootings for the better class of grape scions to be grafted upon. The Imperial valley is as yet free from Phylloxera, and the Vinifera varieties are still planted on their own roots.

The following are on this line: Grape, Raisin and Wine Production, Year book, 1902. Muscat Vines, U. S. Department of Agriculture, Washington. Horticultural Report State of California, 1905-06. Twenty-ninth Fruit Growers' Convention, 1903; State Commissioner of Horticulture, Sacramento. Selection and Preparation of Cuttings, Bioletti, California Experiment Station, Berkeley, Cal.—M. E. S.

IMPROVED FORM OF BLACKLEG VACCINE.

In California, the use of the bothersome powder form of Blackleg Vaccine has been largely supplanted by the more easily used, safer pill form. The advantage of the Blackleg Pills over the powder form of vaccine are that the time and bother of mixing are saved; that the dose is absolutely uniform; that a package may be opened and only a part used, the rest being saved for future use; that the operation of using it is far safer and simpler than that of using the powder form; that the slower absorption of the pills tends to the production of a higher degree of immunity.

They are small and of uniform size. Each pill is a dose for an animal of any age, as on account of the slower absorption, there is no necessity for cutting down the dose for very young animals as is the case with the more quickly absorbed powder vaccine; and, as before stated, the slower absorption of the pills tends to produce a higher degree of immunity.

The injector is a very simple instrument that is practically indestructible, and on account of its simplicity is little likely to get out of order. The operation of vaccinating consists simply of putting a pill in the hollow needle of the injector and after the needle has been pushed into and under the skin (between the skin and muscle) the pill is ejected by means of a plunger which is operated by a thumb-piece on the side. Those who have used the complicated powder form and syringe method can readily appreciate how much simpler the pill and injector method is.

We are assured by the reports of users that the products of The Cutter Laboratory, Berkeley, California, are of the highest standard, and they are certainly fairly priced. This laboratory produces biological products only (vaccines and serums) and makes a specialty of the investigation of infectious diseases of men and animals. Their booklet on Blackleg and Anthrax contains more comprehensive and up-to-date information concerning these two diseases, and others that might be mistaken for them, than anything else we have seen, and every stockman should have one. It may be obtained free by application to the laboratory. Those stockmen who are not familiar with the pill form of vaccine should certainly investigate the matter. If they do they will abandon the use of the uncertain and vexatious powder form.

Veterinary

Dr. R. T. Whittlesey, veterinarian, of 714 East Seventh street, Los Angeles, will answer questions in this department. In writing of sickness or injury to any animal be explicit in giving symptoms and particulars. Always enclose full name and address, but if assumed name or initials are preferred they will be used.

If an immediate mail reply is wished enclose $1.00 for such service, but for replies in paper only, no charge is made if the answer will be of general interest.

Retained Afterbirth.

I have owned from 20 to 40 dairy cows for a great many years and have almost invariably had best of results from them and only lost two very recently. Both of these cows had retained afterbirth and both laid down and died suddenly within two days in one case and four days in the other from the time of dropping calf. Was this caused by the afterbirth, and if so, how should it have been treated? How may it be removed when it does not come away of its own accord?—S. J. Lowe, Palms.

I should suspect parturient paralysis (milk fever so misnamed). Any man who has seen a few cases of it should certainly be able to recognize it. It is not advisable to remove the placenta inside of 24 hours after calving and not to wait longer than two days, or the neck of the uterus may close too small for the hand to pass through. No one should attempt this operation who does not know how, as serious results will be almost certain to follow, and it cannot be described in an article like this.

The retained placenta usualy occure in cows that have calved a few days early, and the length of time to wait depends very much on that as well as the general condition of the cow.

Mange.

Our cow's hide is covered in places with a sort of scurvy or little scaly lumps or sores which seem to itch badly. What is the remedy?—W. W. K., San Gabriel.

Make a thick soap and water emulsion, either with soft soap or common laundry soap, to this add kerosene in the proportions of one to ten; and carbolic acid in the proportion of one to 100. Scrub the affected parts every other day, letting it dry in.

We are in receipt of a valuable and timely illustrated phamphlet entitled "On the Pacific With Our Navy." It has a series of illustrations with many views of the various battleships. It is published "The White House," San Francisco.

The Thornless Cactus Farming Company, of Los Angeles, has issued a booklet regarding Burbank's thornless cactus or opuntia, in which the advantages to be derived from this product are described.

Classified Liners

Rates 1½ cents per word per issue. No ad accepted for less than 25 cents. Our classified columns are the clearing house for the readers of the Cultivator. Here you can insert an ad for the small sum of 1½ cents per word per issue, and be sure that it will be read by thousands.

Household Departmen

MEMORIAL DAY.

Done are the toils and the wearisome marches,
Done is the summons of bugle and drum.
Softly and sweetly the sky overarches,
Shelt'ring a land where Rebellion is dumb.
Dark were the days of the country's derangement,
Sad were the hours when the conflict was on,
But through the gloom of fraternal estrangement
God send His light, and we welcome the dawn.
O'er the expanse of our mighty dominions,
Sweeping away to the uttermost parts,
Peace, the wide-flying, on untiring pinions,
Bringeth her message of joy to our hearts.

Out of the blood of a conflict fraternal
Out of the dust and the dimness of death,
Burst into blossoms of glory eternal
Flowers that sweeten the world with their breath.
Flowers of charity, peace and devotion
Bloom in the hearts that are empty of strife;
Love that is boundless and broad as the ocean
Leaps into beauty and fullness of life.
So, with the singing of paeans and chorals,
And with the flag flashing high in the sun,
Place on the graves of our heoes the laurels
Which their unfaltering valor has won

—Paul Dunbar

THE FATHER OF MEMORIAL DAY.

THE first official observance of May 30 as a day for the decoration of the graves of the Union dead followed a proclamation issued from the headquarters of the Grand Army of the Republic on May 5, 1868, by General John A. Logan, commander in chief. This order read:

"The 30th of May, 1868, is designated for the purpose of strewing with flowers or otherwise decorating the graves of comrades who died in defense of their country during the late rebellion and whose bodies now lie in almost every city, village, hamlet and churchyard in the land. In this observation no form of ceremony is prescribed, but posts and comrades will in their own way arrange such fitting services and testimonials of respect as cirsumstances may permit.

"We are organized, comrades, as our regulations tell us, for the purpose, among other things, of preserving and strengthening those kind and fratenal feelings which have bound together soldiers, sailors and marines who united together to surpress the late rebellion."

"What can aid more to assure this result than by cherishing tenderly the memory of our heroic dead, who made their breasts a barricade between our country and its foes? Their soldier lives were the reveille of freedom to a race in chains and their deaths the tattoo of rebellious tryanny in arms. We should guard their graves with sacred vigilance. All that the consecrated wealth and taste of the nation can add to their adornment and security is but a fitting tribute to the memory of her slain defenders. Let no wanton foot tread rudely in such hallowed grounds. Let pleasant paths invite the coming and going of reverent visitors and fond mourners.

"Let no vandalism of avarice or neglect, no ravages of time, testify to the present or to the coming generatic that we have forgotten as a pe the cost of a free and undivided public.

"If other eyes grow dull and otl hands slack and other hearts gr cold in the solemn trust, ours sh keep it well as long as the light a warmth of life remain to us.

"Let us, then, at the time appoin gather around the sacred remains a garland the passionless mounds ab them with the choicest flowers springtime. Let us raise above th the dear old flag they saved fr dishonor. Let us in this solemn ence renew our pledges to aid and sist those whom they have left amo us, a sacred charge upon a natio gratitude, the soldier's and sa widow and orphan.

"It is the purpose of the comm in-chief to inaugurate this obs with the hope that it will be k from year to year while a s the war remains to honor the of his departed comrades.—J Logan."

RECIPES.

Tomato Puree.

One quart tomato. one p water in which is dissolved te ful beef extract, one bay leaf parsley, stick of celery, six corns and one teaspoonful sug mer until tomato is thorough

Fry a sliced onion in on spoon butter, add one tablespoo and cook but not brown. To t add enough of the tomato t then mix well with rest of to season with salt. Pass throu strainer and heat again before

Fish Salad.

Remove the skin and bon one can of salmon, or an equ tity of any cold fish; chop a with it three large boiled pota the chopped whites of three Make a salad dressing of the three hard boiled eggs rubbed to which has been added pe and half a teaspoonful of musta tablespoonfuls of cream and of vinegar. Pour the dressin the fish just before serving.

French Tapioca.

Into one pint of milk scald double boiler, stir one-third cu quick-cooking tapioca, a dash and one-quarter cupful of sugar. about ten minutes (stirring f ly,) then gradually add thre beaten very light, one teaspoo butter, and a grating of lemon Turn into a mold which has be tered, and then dusted with su in a pan of boiling water and Serve cold with fruit sauce.

Salmon Cakes.

To one can of salmon add o and enough crushed crackers to en to form in balls. Fry in hot

Fig Sauce.

Cut one pound of figs into small pieces; seed half a pound of raisins; add half a cup of sugar, a small glass of currant jelly, and a large cup of water. Stew together until soft and serve as any fruit sauce.

HOMELY HINTS.

Hair brushes are cleaned by dipping their bristles only in water in which ammonia—a teaspoonful to a quart of water—has been added. Work the brushes up and down in the water, but do not allow tnem to get their backs wet.

To remove spots from black woolen goods, apply cold coffee to which has been added a teaspoonful of ammonia to a pint of coffee.

Grease spots may be removed from wall paper by placing over them a piece of blotting paper and then applying a hot iron to the paper.

If new tinware be rubbed over with fresh lard and thoroughly heated in the oven before being used it will never rust afterward, no matter how much it is used in water. For stained tinware borax produces the best result. If a teapot or coffee pot is discolored on the inside boil it in a strong solution of borax for a short time and all its original brightness will return.

Cornstarch will remove grease most effectually. Rub a little fresh, dry cornstarch into the soiled place and it will begin at once the process of absorbing the grease. Brush the first used off carefully from the garment, and proceed in the same way with more until the disfigurement has entirely disappeared.

Bread Scraps.

Don't waste the scraps of bread, but cut them up in small squares. Put in pan in a hot oven and brown nicely. They are splendid for soup or in hot milk for children or for tomatoes. Have a bag to keep the toasted squares hung in the pantry.

Very few people appreciate the cleansing power of pure wheat flour. Delicate woolen things can be easily and quickly cleaned if you give them a flour bath. Take a few handfuls of flour, put it in a basin and cover the article that is to be cleaned. Gently rub the wool in the flour for some minutes. Then shake it well out of an open window. A second rinsing in the flour is generally necessary.

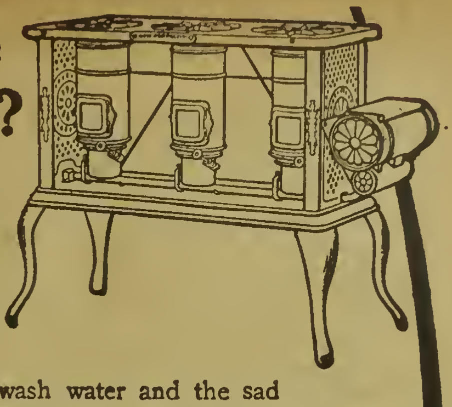
For all bruises, except those on the head, heat is the remedy, but for severe blows on the head cold is doubtless better. Fomentations may be used at intervals to lessen the soreness, but should not be continued more than five minutes at a time.

Sprains.

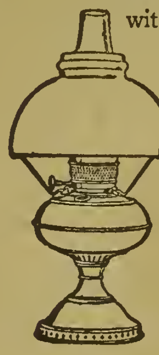
Here again we find heat the best remedy. A hot foot bath will usually relieve the pain and soreness, though there are cases where cold is more efficacious. After the treatment a bandage should be applied and the part given absolute rest. Massage is found to be a successful method of treating sprains. It should be very light at first and increased in vigor from day to day. If the ankle is sprained, the foot should be kept elevated until pain and swelling ceases. If the wrist, the arm can be held in an upright position across the chest by a sling.

FOUR TIMES AS MANY.

Am enclosing money-order to balance account. I put ad in two of Los Angeles' best papers and got four times as many answers from Cultivator.—D. F. Conant, Modesto.



What Stove for Summer?
Nothing adds to kitchen convenience in summer weather like a New Perfection Wick Blue Flame Oil Cook-Stove. Anything that any stove can do the "New Perfection" will do, and *do it better.* Bakes, roasts, boils, toasts; heats the wash water and the sad irons, and does it without dissipating its heat through the room to *your* discomfort. The
NEW PERFECTION
Wick Blue Flame Oil Cook-Stove
actually keeps the kitchen cool—actually makes it comfortable for you while doing the family cooking, because, unlike the coal range, its heat is directed to one point *only*—right under the kettle. Made in three sizes, fully warranted. If not with your dealer, write our nearest agency.



The Rayo LAMP affords a mellow light that is very grateful to tired eyes—a perfect student or family lamp. Brass, nickel plated, hence more durable than other lamps.
If not with your dealer, write our nearest agency.

We Need Good Light

We will all agree to that. We owe it to our eyes and to those of our family.

Acetylene Gas is the best. Ask the Scientific American. Cheaper than coal oil, candle power for candle power. WE WANT YOU TO KNOW our 1908 Model as we and hundreds of others know it. And for that reason we will ship one or place it in your home on 30 days' free trial and trust you to give it a square deal. Ship it back at the end of that time or make settlement.

IS THIS FAIR? Machines in four sizes—20, 35, 50 and 100 lbs. capacity.

If you can sell a few machines in your locality we will tell you something else that will look good, when we hear from you.

Write today. Yours for a square deal,

20th Century Light Company
738 San Pedro St. Los Angeles, California

Citrus Market

LOS ANGELES, May 27, 1908.
Oranges are accepted at advanced rices, though sales are slightly lesened by the high prices and large izes which puts many of smaller ealers out of the business, because of ne price per doz. necessary to charge. he tone of the market is excellent, specially in the Middle West.

Lemons are improving under the armer weather and the demand is risk.

NEW YORK, May 25.—Fifteen carads of navels, four seedlings, three t. Michaels, three lemons, one Jaffa nd one Mediterranean Sweets sold. he demand is fairly active. Lower 1 sizes 80s to 150s. Berries in heavy ceipt. Weather hot and sultry.

ABORTION IN COWS.

A valuable booklet has just been received from the author, which we imagine would be valuable in the hands of every dairyman in this State. It is written by David Roberts, D. V. S., State Veterinarian of Wisconsin, who is also author of the "Practical Home Veterinarian." The book treats on the nature of the disease, effects, how to prevent, relation to other diseases, and ends with the claim that it may be easily prevented. The book is published by the David Roberts Veterinary Company, Waukesha, Wsconsin.

TIRED OUT.

The farmer, at the end of the luncheon, took a liqueur and coffee, and lighted a cigarette.

"Jerome," he said to his oldest son, "press the button, please, and set the automatic plows to work again."

"Oh, bother!" growled Jerome. "Let Clarence do it; I'm tired."

Many of the most thoughtful sermons are wordless.

There are a thousand little things to be done about the house and farm that you are called upon to do yourself if they are done at all.

To do them rightly and easily you require good tools—better tools, indeed, than the carpenter, because he has the means of sharpening, setting, and adjusting, which you have not.

For the home, the shop, or the farm, there are no tools equal in any respect to

CRESOLENE

Lice Killer
Disinfectant
and Dip

Dilute With Water Before Using

CRESOLENE is a powerful disinfectant, insecticide and germicide obtained from coal tar. It is non-poisonous, and non-corrosive and will do no harm to the most delicate skin.

It mixes readily with water, forming a milky emulsion, and can, therefore, be diluted from 50 to 100 times its own bulk, in accordance with the different uses to which it is put.

Thus when you purchase 1 gallon of CRESOLENE you can make up to 100 gallons of the best disinfectant at a cost of only 11-4 cents per gallon. Write us for particulars and guarantee.

the Heart of the Mighty Valley

A Scene on the Main Canal in the Tulare Irrigation District, which Creates a Smiling Garden of Fertility

RACED within the borders of the great State of California several wonderful valleys, each a vast empire in itself, and an important factor in the rapid development and marvel- ress of a State whose very name suggests sunshine and l fruits and flowers. By far the largest and most import- l is the great San Joaquin valley, a princely domain, 250 length and from 40 to 80 miles in width, embracing eight Upon one side it is flanked by the mighty Sierra Nevada, the highest range of mountains in the United States, and upon the other by the less lofty parallel Coast Range. From the western slope of the rugged Sierras there flows into the valley a series of splendid rivers, that fork into numerous branches, forming true delta lands like those of the Nile or Ganges. Ages ago these rivers and streams would overflow, inundating the whole country, and thus were deposited the rich layers of silt and sediment that today nourish vines and fruit trees, waving fields of grain, and great pastures of alfalfa.—Out West.

ulphured Fruit and the Pure Food Law

An Address Before the State Fruit Growers Convention at Riverside, April 30, 1908

By ARTHUR R. BRIGGS, President of the State Board of Trade

E people of no State in the Union were iore zealous advocates of a National Pure ood Law than were the people of Califor- Adulteration of food products in other States, sted the need of statutory regulation in the st of life and health and as a protection anufactures of pure food products. There- gratification and general approval were ex- ed on the part of producers in this State, Congress on June 30th, 1906, passed the onal Food and Drugs Act." One of the pal features of the Act was to prevent the facture, or sale, of adulterated or deleteri- ood products, and it prescribed the method which adulterated foods and drugs might be

w comprehensively the term "deleterious " was to be interpreted, how a determina- vas to be made in respect to them, and the of manufacturers and producers pending a mination, were matters too remote for im- ite consideration and excited little interest. , as the law was put in operation and its was brought to their attention, manufact- and distributors of food products were much ised over the particular features of the which affected their business.

der the Act three cabinet officers were ed with the duty of making rules and regu- s for carrying out its provisions, the spe- terms being set forth as follows:

c. 3. That the Secretary of the Treasury, Secretary of Agriculture and the Secretary mmerce and Labor, shall make uniform and regulations for carrying out the pro- ns of this Act, including the collection and ination of specimens of foods and drugs factured or offered for sale in the District lumbia, or in any Territory of the United s, or which shall be offered for sale in un- en packages in any State other than that hich they shall have been respectively manu- red or produced, or which shall be received any foreign country, or intended for ship- to any foreign country, or which may be itted for examination by the chief health, or drug officer of any State, territory or the ict of Columbia or at any domestic or for- port through which such product is offered nterstate commerce or for export or import een the United States or any foreign port or try."

ec. 4. That the examinations of specimens ods and drugs shall be made in the Bureau of nistry of the Department of Agriculture, or r the direction and supervision of such Bu- for the purpose of determining from such inations whether such articles are adul- ed or misbranded within the meaning of this

e Bureau of Chemistry of the Department of culture, by the Act, is made the agency for ination of products, and the head of that ch of the Department, therefore, occupies a ion of much importance. The point of y seemed to be, that it rested with the Sec- ry of Agriculture, jointly with the Secretary e Treasury and the Secretary of Commerce Labor, to promulgate rules and regulations carrying out the provisions of the Act. It further provided:

ec. 7. That for the purpose of this Act an article shall be deemed to be adulterated: . . . In the case of food:

"If it contain any added poisonous or other added deleterious ingredient which may render such article injurious to health: Provided, that when in the preparation of food products for shipment they are preserved by any external application applied in such manner that the preservative is necessarily removed mechanically or by maceration in water or otherwise, and directions for the removal of said preservative shall be printed on the covering or the package, the provisions of this Act shall be construed as applying only when said products are ready for consumption."

No special concern on the part of those interested in fruit was felt, as to the effect of the law as expressed in the Act. It was not until the "Board of Food and Drug Inspection" suggested, and the Secretary of Agriculture promulgated, on July 13, 1907, "Food Inspection Decision 76."

This decision was deemed drastic in its terms and made a large portion of the fruit dried in, and marketed from this State, contraband under the law. It says:

"It is provided in Regulation 15 of the rules and regulations for the enforcement of the Food and Drugs Act, that the Secretary of Agriculture shall determine by chemical or other examinations those substances which are permitted or inhibited in food products; that he shall determine from time to time the principles which shall guide the use of colors, preservatives and other substances added to foods; and that when these findings and determinations of the Secretary of Agriculture are approved by the Secretary of the Treasury and the Secretary of Commerce and Labor, the principles so established shall become a part of the rules and regulations for the enforcement of the Food and Drugs Act.

"The law provides that no food or food product intended for interstate commerce, nor any food or food product manufactured or sold in the District of Columbia or in any Territory of the United States, or for foreign commerce, except as hereinafter provided, shall contain substances which lessen the wholesomeness or which add any deleterious properties thereto. It has been determined that no drug, chemical or harmful or deleterious dye or preservative may be used. Common salt, sugar, wood smoke, potable distilled liquors, vinegar and condiments may be used. Pending further investigation, the use of saltpeter is allowed.

"Pending the investigation of the conditions attending processes of manufacture and the effect upon health, of the combinations mentioned in this paragraph, the Department of Agriculture will institute no prosecution in the case of the application of fumes of burning sulphur (sulphur dioxide,) as usually employed in the manufacture of those foods and food products which contain acetaldehyde, sugars, etc., with which sulphurous acid may combine, if the total amount of sulphur dioxide in the finished product, does not exceed 350 milligrams per liter in wines or 350 milligrams per kilogram in other food products, of which not over 70 milligrams is in a free state."

"The label of each package of sulphured foods or of foods containing sodium benzoate or benzic acid, shall bear a statement that the food is preserved with sulphur dioxide, or with sodium benzoate or benzoic acid, as the case may be, and the label must not bear a serial number assigned to any guaranty filed with the Department of Agriculture nor any statement that the article is guaranteed to conform to the Food and Drugs Act."

It is well known that sulphur is almost universally used in this State in drying peaches, apricots and pears and to quite an extent in drying plums and apples. It is admitted that the fruit when dried, in its raw state, contains a greater percentage of "sulphur dioxide," produced by the fumes of burning sulphur, than 350 milligrams per kilogram or an equivalent of 35-1000 of one per cent. Experience has shown that the use of sulphur was a necessity, in order to produce dried fruit of the color and quality required for consumption in any market. It has also demonstrated that at the unit fixed by ruling 76, viz.: 35-1000 of one per cent, the fruit would not keep for storage nor shipment to distant markets, nor could it be dried without serious loss from decay during the drying process. A large part of the dried fruit cured in this State did not come within the limit prescribed in Decision 76 and was, therefore, contraband, subject to seizure and confiscation as unwholesome and deleterious product. The decision provided that "pending investigation of conditions attending processes of manufacture and the effects on health" that the Department of Agriculture would institute no prosecutions against fruit containing sulphur dioxid when prepared in the usual manner.

This provision did not furnish sufficient assurance of safety, for the reason that the time of immunity granted was indefinite and very uncertain.

Strong representation was made to Secretary Wilson setting forth in forcible manner the disastrous effect Decision 76 would have from this indefinite feature as to time on the fruit interest of the State. The secretary visited California during the curing season of the year 1907, and afforded opportunity, both public and private for and representations or demonstrations in respect to fruit drying in the State that were sought to be made. Under assurances given by Secretary Wilson, the busines of drying, packing and distributing fruit during 1907 went forward without much interruption.

At the beginning of the year 1908, Decision 76, by reason of limitation as to qualification for the previous year, was in force as a part of the rules and regulations for the enforcement of the "Food and Drugs Act." Uncertainty as to the future policy of the department and the apparent attitude of hostility on the part of the Bureau of Chemistry, in charge of Dr. H. W. Wiley, excited apprehension, caused a stagnation in the fruit industry in the State, and made further effort on behalf of growers and distributors necessary.

During the season 1907 large sums had been expended by the Bureau of Chemistry, under direction of the Agricultural Department, in obtaining samples of fruit cured by use of sulphur, in studying the processes of manufacture, in making scientific tests and in supplying information on which the department might be able to fix a permanent safety unit of sulphur dioxide, in fruit, and thus restore confidence to the fruit industry. It was presumed when the Bureau of Chemistry began its investigations in California that the findings would be made public through the de-

A MODEL PACKING HOUSE.

IT WAS our pleasure the other day to visit the packing house of Mr. C. E. Rumsey at Pachappa. This house is built with the idea of handling the fruit as little and as carefully as possible.

The fruit is loaded on especially made wagons built low so that the boxes of fruit may be wheeled from the wagon into the packing house on trucks which have rubber tires. The general features of the packing house are the same as most of recently built houses, excepting that it is provided with ventilators which can be adjusted to a nicety, making the main part of the building one so that it can be closed tight or opened wide with all the intervening degrees of ventilation at the operators command.

The fruit is dumped into an inclined feeder that has an automatic dumping apparatus that prevents the fruit from being piled up, allowing only a certain amount of fruit to roll out of the boxes during the dumping process. As the fruit rolls out of the box it is held slightly in check by a heavy canvas curtain that hangs down in front of the fruit as it leaves the box so that the fruit that is at the top of the pile does not shoot across the inclined plane that leafs to the grading belts. Before reaching the belts, the fruit passes over a space in which rubber covered slats with spaces between allow the trash that may be in the boxes, to fall through. The fruit is then passed and graded in the usual way with the machinery that is used in all the latest improved packing houses till it gets to the packers. Here each packer is instructed to use the utmost care in making an attractive pack. The boxes are all cleated so as to get a high pack. This is supplemented by putting a high cleat across the top of the partition so as to prevent the orange from getting in contact with the sharp edges of the top of the partitions. The packed boxes are placed on a long table which has a stationary carrier with ballbearing rollers over which a box of oranges will glide the whole distance of the packing house with a slight push by the hand. These roller carriers convey the packed boxes to the bench where the tops are nailed on. Here is a press with side adjustments that prevent the top oranges from being pinched while the top is being pressed down. From the topping bench, the boxes are run into the car on the same kind of a carrier, only the boxes run by gravity into the cars. The benches by the packers and running parallel with the stationary carriers, enable the topper to select the sizes he wishes to put into the car, those not required at the time, being left on the benches, all that is required when those held in reserve are called for, is to push them on the carrier and give a gentle push with the hand and they go sliding down to the topper who, after nailing the tops in, feeds them into the car, as he sets them off of his bench.

In this house, not an orange is touched with the hand; in fact, they are not touched with the hand at all, even the pickers are required to use gloves to cover the finger nails. There is not a detail overlooked where the fruit may be saved from injury from the time it leaves the tree till it finds its way into the car.

In each car is placed an addressed envelope containing the packer's number and a request that the consumer mail back to Mr. Rumsey any complaint that may be occasioned by an unsatisfactory condition of the fruit.—J. W. Mills.

SUMMER CULTIVATION.

Cultivation of orchards was discussed at length at the recent institutes with much benefit, considering that it is such a time-worn subject. The general impression seemed to prevail, that deep plowing was not the best method to follow when the character of the soil will permit shallow cultivation. The point to keep in mind is to provide a mulch that will act like a blanket and prevent evaporation. As soon as the loose top earth settles so that a communication is started between it and the subsoil, the water in the soil at once starts upward. The mulch should be thick enough to prevent the heat of the day from driving out the moisture by heating it. In light sandy soils this condition is easily made without the use of a plow. The cultivator is much cheaper and the work is more conveniently done. Instances were cited where light soils had been handled without even a cultivator being used, merely a harrow to mellow the surface in conjunction with plenty of stable manure and some commercial fertilizer. Others had good results where the soil was about the same, and deep plowing was practiced both ways every year, with less irrigation. It was asserted by some growers who had done considerable experimenting with both plowing and cultivation, that they had better results when they cultivated without plowing first. They grew green crops and disked them several ways till the vegetation was all worked into the surface, and when that was well rotted, they cultivated with a straight, narrow-toothed cultivator.

It was generally conceded that in heavy soils it was necessary to plow deep enough in the late winter to get below the line of depth of the cultivator teeth in order to break up the crust caused by the constant rubbing on the teeth at that point.

Taking all evidence into consideration, it seems best to allow the trees to maintain their natural habit of shallow rooting to a point where it does not interfere with maintaining a satisfactory dust mulch. Where these conditions prevail, larger crops of fruit have been the result. Shallow rooting, however, seems to tend to early ripening and this means early dropping in the case of Washington navels. If these conditions will always prevail, no doubt the time will come when growers will manipulate their groves so that they will have early and late fruit. This will be quite an advance in citrus culture, and indicates that many possibilities are in store for this line of horticulture.—J. W. Mills.

NOT LOST.

A "Big Indian" strayed away from his camp and got lost. Inquiring the way back, he was asked: "Indian lost?" "No." said he, disdainfully, "Indian no lost—wigwam lost." Striking his breast, he exclaimed, "Indian here!"

Apricots over the San Joaquin Valley will be very heavy this season.

A GOOD FRUIT SEASON.

HERE is no question at the present writing as to the fruit crop of the present season. From all rts of the State, and in relation to varieties of fruit, come the same ɔorts, that it is the heaviest crop ıt has set in many years past. All .sses of fruit, with perhaps the exption of prunes, will yield very avily, and of the latter there will ɔbably be at least a fair crop. In principal prune sections there is ıch complaint of the dropping of young fruit, which will materially sen the output, especially in the nta Clara district. In other parts the State prunes are setting bet-, and on the whole, we may expect fair crop of prunes in addition to a ry large crop of all other fruits.

A VALUABLE INSECTICIDE.

Aerial insects, those which work ove ground and in the open, are comparatively easy control. We n reach them with sprays or poiss or caustic washes, and while it quires much trouble and considera- expense to control them we can, we please, hold them in check. bterranean pests, however, are ite another matter. These are ose which burrow beneath the ound, and are safely out of reach ordinary applications. In this oup are the dreaded phyloxera of grape, the wooly aphis of the ap-, cut worms and the myriad of ıaller pests, which have been so beyond our reach, and which have rried on their destructive work in ite of all our efforts to check them. ıe Cooper Research Laboratory, of rkhamstead, England, one of the gest and most reliable institutions its kind in the world, claims to ve discovered a preparation which ll penetrate the soil and destroy bterranean pests as readily as rays or gases will destroy aerial ms. This substance is in the form a powder and is dusted over the rface and covered. It has been med "Apterite," and writing of it, of. Walter E. Collinge says: "Apite is quite distinct from, and a eat advance upon, any of the soiled soil insecticides, for the active inciple works upwards and downırds." If Apterite will do even a rt of what is claimed for it, it will ove one of the greatest boons the chardists and agriculturists have er had, for it is the underground sts which do the greatest damage at e present time.

QUARANTINE ON COTTON SEED.

It is pleasant to note that the De-ırtment of Agriculture at Washingn not only respects the efforts of ılifornia to protect herself against w pests, but is willing to assist in e work. This has been evidenced in e suggestion received from the deırtment that there was danger to be ɔprehended in the importation of cotn seed from infested sections of the ɔuthern States and that it would be ell to take precautions against the ɔtton boll weevil, which is such a arful pest there. California is not, has not been, a cotton producing ate, but now there are to be some tensive experiments in cotton growg made in the Imperial valley, and this end cotton seed in bulk is ɔout to be imported. The weevil ɔes not attack the seed, but where this is kept in bulk, there is always danger that the pest may have found lodgment amongst it. For these reasons, Horticultural Commissioner Jeffrey has declared a quarantine against all cotton seed, and prescribed a careful inspection and fumigation before it can be delivered to the planters. Certain sections of Southern California have been designated as points of entry, and only through these can the seed be entered. The precaution is a wise one, for while cotton is the chief food plant of this pest, there is a probability that, if this food were scarce, it might betake itself to something else. You cannot always tell what an isect introduced into a new section will do.

TO PROTECT USERS OF INSECTICIDES.

A bill was drawn up, and an effort made to get it before congress, requiring manufacturers of insecticides to guarantee their composition. It also provided for their inspection and analysis by the Bureau of Chemistry, and the punishment of persons selling fradulent insecticides or fungicides. In this State we already have a law providing for the inspection of Paris green and defining the minimum quantity of arsenious acid it shall contain, but a general law, such as the one proposed, would certainly be much better and is much needed. It is in line with the pure food law, and the fertilizer laws of the different States, and is designed to afford protection to the fruit grower and farmer in the use of remedies against his insect and fungus foes. Fraud in such matters, not alone cheats the purchaser out of the purchase price, but robs him infinitely more, in his labor and the year's income of his property. The measure is a good one, and it is to be hoped that it will become a law at an early date.

IRRIGATION IN NORTHERN COUNTIES.

The great shortage in the normal rainfall has made irrigation in the northern fruit section a necessity, and orchardists have been using water for the past month. In most sections the winter rainfall is usualy ample to fill the ground, and by cultivation it can be conserved for the trees and the artificial application of water is unnecessary. This season, however, it is the reverse and irrigation has become an absolute necessity. In Sutter county very many wells have been dug and pumping plants installed, and in many parts where drainage has heretofore been the rule, irrigation is now being resorted to.

TAKING NO CHANCES.

In the face of the employers' liability law, we notice that some of the larger canning companies are preparing themselves against contingencies, by taking out indemnity policies, by which they are guaranteed against loss by lawsuit or otherwise, in case of accident to employees. By paying the premium, the company is relieved from responsibility and the insurance company assumes it. It is more than probable that an injured employee would have a big lawsuit on hand before the insurance company would pay.

One company has already made a purchase of over 25 cars of early table grapes at Imperial.

HIT THE NAIL
ON THE HEAD

You can "hit the nail on the head" by securing one of the well known Osborne machines. You will be perfectly satisfied with your purchase because you know you have the machine that will handle your harvest in the shortest time and with the most precision. No stops for repairs.

OSBORNE MACHINES

for 1908 have been improved wherever it was possible to do so, and they will meet the varying requirements of different localties. If you want to be satisfied and

TREE TANGLEFOOT

A Sticky Preparation Applied Directly to the Bark of the Trees

Will not injure trees. A band 5 inches wide and 1-16-inch thick cannot be crossed by any climbing insect pest. Remains sticky five to ten times as long as any other known substance. You can test it at slight expense, as no apparatus is required. Used by the carload in New England against the Gypsy and Brown-Tail Moths. In California it preserves prune orchards from the Canker Worm Wherever the Gypsy or Brown-tail Moths, Tussock Moths fall or Spring Canker Worm or Web Worm appear TREE TANGLEFOOT is of great value, and should be used when the caterpillars begin to crawl while they are very young.

Price 25c per lb. Liberal discount on quantities. The only safe and effective banding preparation. Send for testimonials.

Fuller's rose-beetle.	A-ram-i-gus ful-ler-i.	O-ti-o-rhyn chi-dae.	Roots of plants, foliage ange, etc.
Bean weevil.	Bru-chus ob-tec-tus.	Bru-chi-dae.	Beans in pod.
Pea weevil.	Bru-chus pi-si.	Bru-chi-dae.	Peas in pod.
Wire worms; click beetles.	Mel-a-no-tus sp.	El-a-ter-i-dae.	Alfalfa, etc., et
Bigheaded borer.	Chrys-o-both-ris fem-o-ra-ta.	Bu-pres-ti-dae.	Apricots, apples etc., etc.
Plant lice.	Phyl-lox-e-ra vas-ta-trix.	Aph-i-di-i-dae.	Grape.
Plant lice.	A-phis sp.	"	Melons, peas, et
White fly.	Al-ey-ro-des cit-ri.	Al-ey-rod-i-dae.	Orange, etc.
False chinch bug.	Nys-i-us de-struc-tor.	Ly-gae-i-dae.	Grapes and man den vegetables

In giving this list, I have given the pronunciation, as I have had frequent inquiries from our numerous horticultural commissioners and inspectors regarding the same. In the names contained in these following lists, the long English sound is to be given to vowels in acented sylables ending in a vowel, as in Le-ca-ni-um; when final, as in **beck**-i-i; and in final es, as in Al-ey-**ro**-des; elsewhere, in general, the short sound, as in Coc-ci-dae; ch has the sound of k, as in Chal-cid; g before e, i, ae or oe has the sound of j, as in Li-gy-rus; oe and ae are pronounced like e, as in koeb-el-ae.

Accented sylables are indicated by blackface type.

The frequent and perplexing changes in names is necessary. There are two reasons for such changes, both of which are conclusive: one, the law of priority; the other, the avoidance of duplicating names in
closely related groups. Of cours
necessity of uniformity makes
perative that we have some rule
shall be observed by all. Let me
that in writing a name, the fi
generic name should always be
talized; the species never. E
we could have Vedalia roosev
Vedalia powelli the r and p wo
small letters not capitals.

The next table will give our
friends; and let me add that
friends belong to two distinct g
the parasitic insects, those that
inside their victims, like the g
Chalcid of the yellow scale; and
predaceous species, those that d
their prey as does the cat the m
The Vedalia and, indeed, all the
bird beetles belong in the latter g

Of the parasitic group we
three families; the Chalcids, Ich
monids and the Braconids; and
family of the Diptera, or two
flies, the Tachinids. I give the
this order in the following table:

ION NAMES	SCIENTIFIC NAMES.	FAMILY.	INSECT ATTACKED.
n chalcid	As-pld-i-o-toph-a-gus cit-rl-nus.	Chal-ci-dac.	Yellow scale.
Jose scale cid.	A-phel-i-nus fus-ci-pen-nis.	"	San Jose scale.
y scale chal-	A-phel-i-nus di-as-pi-dis.	"	Greedy scale.
y scale chal-	A-phel-i-nus myt-il-as-pi-dis.	"	Greedy scale, etc.
ot scale chal-	Co-mys fus-ca.	"	Apricot scale.
oak moth cid.	Chal-cis o-va-ta.	"	Oak moth.
scale chalcid.	Coc-coph-a-gus le-ca-ni-i.	"	Soft brown scale.

ere are numerous bugs that help eep down our various pests. The wings, especially the Chrys-o-pa or green-wing Chrysopa is of al note as an enemy of the plant

r. Pease has called attention to fact that most of our dreaded s, many of which would be terv serious, are held in check almost rely by their insect enemies. The brown scale and the cottony ion scale are striking examples. of these scales are exceptionally ific, yet both are rendered harm, and the last by an imported spe, the Vedalia.

here are four species of scale ins, the red, purple, black and yelscale, which when present seriousnjure and in time ruin our citrus es. Thus in many sections, imity from harm means great annual ense. Massachusetts, after spend well toward a million dollars in bating the gipsy moth and the red moth, has now done what Califors experience might have suggested he start, imported their European mies, and already substantial prog; is made in overcoming these two alarming scourges. The devastation of the cotton boll weevil of the Southern States was so threatening that large appropriations have been made by Congress to secure effective remedies against it. We now have the encouraging report that native parasitic and predaceous species have come to the rescue and are promising to be effective in staying the evil wrought by this snout beetle. We should remember always that these insect friends "work for nothing and board themselves." We are grateful for the discovery of such efficient remedies as gassing with cyanide, but how much more grateful for the introduction of such species as the Vedalia, for we are thus saved all anxiety as well as the great expense and labor of fighting our pests. Mr. Bemis shows us that we must gas unless our friends are masters of the situation. To wait for the Scutellista or Golden Chalcid until our groves are ruined or materially injured by the black or yellow scale, is the height of folly. The wise course would seem to be to fight our pests by the best method, unless their enemies are sufficient to keep them down; and in case we do not now have efficient parasites or predaceous species, to hunt for them with the keenest vision that we can secure.

This brings me to the climax of the whole matter: We must listen to the wise words of Professor Vernon L. Kellogg spoken at the Marysville meeting; we should have at once a State entomologist. Think of it! Despite all the losses our gross returns from our orchards are something like seventy-five million dollars. If, as good authority has it, twenty per cent of this sum, or one-fifth, is sacrificed through insect ravages, then we see that our annual loss is from twelve to fifteen million dollars. When we add to this the immense sum expended yearly in fighting our foes, we have data that should induce immediate action. We cannot estimate the great benefit that has come through Harris, Fitch, Walsh and Riley, not to mention a host of other workers in this important field. Millions would not measure the benefit to our country derived from Riley's extensive researches, while State Entomologist of Missouri. With so much at stake, we should see to it at once and insist that we have the most competent man that we can procure and equip him, as suggested by Professor Kellogg, with assistants and means to travel and inevstigate, and should pay a salary that would secure the ablest talent to be found. This man should be free from the influence of politics and responsible only to the fruit rowers. His whole time and energy should be devoted to research in practical entomology. The Professors at the University have teaching that distracts, and our able entomologists now connected with the State Horticultural Commission, have duties in relation to quarantine and breeding insects that disqualify them for this huge work. It is a field that would take the entire time and tax the energy to the utmost of the best man that can be secured. With the right man, miillons would be saved annually to our fruit growers. When we consider our immense orchards, the enormous production, and the frightful loss from insect ravages, it seems strange that our fruit men, usually so full of enterprise and energy have not, long ere this, insisted that we have a State Entomologist who shall give his entire time to the study of our insect foes. It would be wise economy if the Horticulture Board should add to their present force a man to give his entire time to field work and investigations concerning insects.

WALK 2450 MILES.

Over mountains and through snow, through wet, slush and mud, freezing at times, and oppressed by heat at others, William Jackson and R. T. Hay, two sturdy Scotchman, walked every mile of the way from Seattle to Chicago, just arriving within a few hours of the time limit, thereby winning a purse of Fifteen Hundred Dollars given by the Seattle Athletic Club.

Jackson and Hay left Seattle with but Five Dollars in money, were obliged to earn their way as they went and leave no unpaid bills, and complete the journey in ninety days.

An interesting incident in connection with the walk, was that each of the contestants wore a pair of the well-known Mayer shoes, that neither ripped nor lost a stitch during the entire trip of 2450 miles, speaking volumnes for the extraordinary wearing qualities of the shoes manufactured by the F. Mayer Boot and Shoe Co., Milwaukee.

The Ornamental Garde

BULBS.

Bulbs for the garden and house should be planted in rich, deeply worked garden soil, set, according to the size of the bulb, at a depth of from two to four or more inches.

As the blossoms from these are so very striking and ornamental it is desirable to locate the beds where they may be seen both from the windows of the living room and from the street. As a broad border beside the house they will give satisfaction on any side except the north, but a south and east exposure are good. They may be planted in quite close rows, where great space cannot be afforded.

For house culture jonquils and daffodils may be planted in pots—the larger bulbs singly and the small ones, like those of the crocus and ixia, four or six in five-inch pots filled with rich earth mingled with about one-third sand with lumps of charcoal for drainage. After planting stand in cellar for a few weeks, watering occasionally until well rooted, when the pots may be brought, in succession, to a sunny window where they will soon be in full bloom.

For mantel or bracket ornaments hyacinths and the white paper narcissus and Chinese sacred lilly may be grown in regular bulb glasses or dishes. These must be washed and rinsed to perfect clearness and for hyacinths filled with pure water to the base of the bulb, which has a bowl-like expansion fitted for its reception where it must just touch the water. The bulb glasses are then set in a dark closet until the roots have filled the lower part of the glass, and the bud is showing. This will require from four to six weeks, when it may be brought into the light to complete the development of the flower truss.

The bulbs of the narcissi are planter several together, among small, well-washed pebbles in a deep ornamental dish and placed at once in a good light, but not in direct sunshine. These will soon begin to grow and produce a succession of blossoms for six or eight weeks. Other small bulbs not so generally grown, but very attractive, are the ixias and sparaxis, popularly known as "rainbow flowers" from their variegated colors.

INSECTS ON HOUSE PLANTS.

Give the plants a bath of tobacco water once a month. Take a 5-cent package of tobacco, put in a pail and pour about half a gallon of boiling water over it. When this is cooled, pour it off and dilute until it is the color of weak tea. Dip the plants into this, completely covering them. Let them dry and then repeat the process. When they have dried the second time, thoroughly spray with clear water until the tobacco is quite washed off. Plants treated is this way will seldom have an insect on them. Neither will those that are growing vigorously, as the parasites seldom attack a healthy, vigorous plant.—Florida Agriculturist.

FERTILIZE LAWNS.

Regarding fertilizers for lawns, the Balfour, Guthrie & Co., of Los Angeles recently wrote Prof. Hilgard at Berkeley and he has sent the following reply:

In response to yours of the 6th regarding the use of Thomas phosphate on lawns, I state that when the soils are of a sandy nature the use of Thomas phosphate will answer very
well. If, however, it is more o
adobe character it will be more
sirable to use superphosphate
heavy soils it is necessary for
Thomas phosphate to be worke
by means of tools. Under these
ditions Thomas phosphate is f
used in Europe for the dressing
meadows, especially such as are
riodically flooded, and as meadow
well as lawns are apt to become
in the course of time, the Tho
phosphate is better intrinsically
the acid phosphate. It is, of co
understood that lawns are wa
frequently and rather abunda
since otherwise the phosphate po
might remain inert on the surface

The amount of phosphate po
per acre should be from four
dred to five hundred pounds of
finest grade; and of the super
phate of say 15 per cent soluble, a
three hundred pounds can be a
per acre.

It is said that by planting
beans at intervals among ros
shrubbery, insect pests will n
near so troublesome. Does any
know from experience?

Pansies are "high livers."

Small Fruits and Vegetables

THIS MONTH.

"A ARDEN SASS" tastes good these days, so that the earlier care and work are now yielding their reward. Work done now may be appreciated later. Sow beans and cabbage for late crop, sweet corn, cress, cucumbers, okra, muskmelons, peas, parsnips. Plant egg plant, sweet potatoes, horseradish and rhubarb roots and strawberry plants. Keep soil well cutivated and hoed in order that the crops will stand the heat of the coming summer.

TO GROW MUSHROOMS.

A temperature ranging from 50 to 60 degrees is required for the growing of mushrooms. This is a plant which has no green leaves and, therefore, does not require sunlight, therefore an old cave or cellar or a shed in which the temperature will not drop below 4o degrees, and in which it will remain close to 55 degrees at all times, is the ideal place to make the mushroom beds. A framework of any convenient length and width, deep enough to contain about 12 inches of well picked compost is the required structure in which to build the bed. Fresh horse manure that is nearly free from straw or litter is generally used to grow mushrooms, and it should be gathered as rapidly as possible. The manure should be placed in a pile to induce fermentation, but should also be carefully turned and mixed once a day to prevent burning. For a week or ten days the heat in the pile will be intense, but it will gradually subside, and after this stage has passed the manure is ready to place in the beds. The manure is placed in the beds in layers and well pounded down with a mallet or block, making it as compact as possible until ten iinches deep. A thermometer should be placed in this compact mass of manure and the temperature closely watched until it has reached about 90 degrees, when the spawn should be planted.

The spawn is purchased from seedsmen in the form of dried bricks, which contain what corresponds to the seeds of the plant. These bricks are broken into pieces of half-inch to an inch square and inserted in holes in the manure about three inches deep and four or five inches apart each way. The surface should be well pressed down after planting.

A coat of good loose soil, two inches thick should be put on the bed about ten days after planting; this is made firm and a mulch of hay or straw piled on to assist in retaining moisture. Sometimes it becomes necessary to wet the beds, but the greatest success will come from keeping the atmosphere in the cellar or shed sufficiently moist to prevent the compost drying.

ONIONS.

It seems to me that here in this irrigated country transplanted onions pay the best profit. Most people object to transplanting because they say it costs too much. From figures I have kept I find that it costs about $30 to set out the plants on an acre, assuming that a man can set 5000 plants a day. That would be one every ten seconds in a ten-hour day and I should be constantly reminded that I had a back if I tried it. With a boy to drop the plants for him, an active man might do it but he would have no time to tell stories or look at the scenery. With all that I think the work of transplanting is less than thinning or weeding with the fingers. The real objection to transplanting is the difficulty of doing it all at once. It will not do to let it dawdle along. When ready to transplant put all hands at it and see that they work. Nothing has made such a deep impression upon the market garden as this process of growing the onion plants in a bed and removing them to the field after they have become strong and of size to make field culture feasible. By this plan our Western onion growers are able to put upon the market bulbs one year from the seed equal to the best imported onions and it has in a degree revolutionized this industry. The seed is sown in drills an inch and a half or two inches apart.—Exchange.

SACRAMENTO ALL RIGHT.

Sacramento seems to be in step with the swing of the entire State and is claiming a great future, and its present advancement seems to justify the claims of its warmest friends. A Cultivator representative now working in the immediate surroundings of Sacramento writes that the most hopeful feeling he has observed prevails about that section. He says the prospect that the government will dredge the river to permit of ocean going vessels coming up to the city will greatly stimulate the growth of the city. Besides this, the many large grain ranches aoout the city are being subdivided and are making homes for a vast number of small fruit and garden people. And being so situated that much of the traffic of the State passes through it and lines of travel radiating in all directions will largely increase its prestige.

May it meet the expectation of its warmest friends.

When the potato scab and blight germs once gain a foothold in the ground they can only be eradicated by rotation of crops and even then with difficulty. There seems to be no remedy for the disease once firmly rooted in the ground other than rotation. The root blight is evidenced by immense tops, for the disease attacks the tubers leaving no place to store nourishment, and hence the tops immediately take up the plant energy and grow to abnormal size. It is also indicated by a preponderance of small potatoes, too small to be of any value whatever. Sometimes it does not allow the potato shoots to even reach the surface of the ground but cuts them off, especially when the growth is slow and the shoots are small and weak. Practically the only remedy for this disease is in the choosing of seed, taking great care to avoid potatoes with scabs on them, those with rough brown spots and those with black spots. Roughness of the potato seems to indicate this trouble generally.—Field and Farm.

The fruitman or gardener who successfully combats the different diseases or pests always has the spraying materials on hand at all times and the spraying machinery in such order that it can be used on a moment's notice. Thorough preparation acounts for much of the success in the progressive fruitman's orchard or garden.

THE APRICOT CROP.

Reports from nearly all sections of the State indicate the most promising outlook for the output of apricots, though some sections report half of a full crop, but with fruit of exceptional size and quality. Prices for the green fruit will probably range from $12 to $20, and prediction for dried 'cots is about half that of last year or 10 to 12 cents. These are merely surface indications, as it is yet too early to give absolute figures, especially for cured product.

KEEP OUT THE SMELTERS.

The effort which is being made on the part of some commercial bodies in Los Angeles to secure the establishment of smelters between the city and the ocean should be discouraged if possible. We have before us a circular issued by the Haywards Business Mens' Association calling for a mass meeting to protest against the erection of a smelter at Baden in San Mateo county. That location is several miles away and across the bay of San Francisco. But from experience in other sections the well-wishers of Haywards do not feel it safe to permit the erection of this blight upon all things which have life, even if it be miles away. The circular says that by the operation of this smelter "many tons of sulphurous and arsenical vapors will be discharged into the air daily and, condensing, settle upon the country within a radius of a score of miles, withering and destroying all vegetation and causing more or less injury to animal life."

We think perhaps the "score of miles" may be somewhat overdrawn, although with the strong trade winds always prevailing it may be possible the injury might reach that far. We have heard it estimated that as low as one-half mile to a mile from these institutions is the limit of the destruction of all plant life. But even then it is plain that such an institution would be a blight upon a section which placed so much dependence upon and secures so much financial return from its asset of things beautiful.

California wishes establishments which tend to its commercial advancement, but that advancement, we believe, would be more rapid along other lines and abundantly compensate for the loss of such an institution, rather than to jeopardize producing interests.

A LIVE STOCK SHOW.

We have a communication from Dr. R. T. Whittlesey suggesting the holding of a live stock show in connection with the meeting of the National Live Stock Association which will be held in Los Angeles in January next. This is surely an excellent suggestion, though at first thought the claim may be made that Los Angeles being the center of an almost exclusive fruit producing section, the live stock interest may not be strong enough to secure a showing which will be equal to that of some of the more representative stock sections of the East.

Therein lies the merit of such a show, for we believe that the northern part of the State will join in such an effort and that the best of showing may be made from the southern end of the State as well in a way which will surprise even our own people. There are many excellent specimens of highbred live stock in this State, and we believe such a gathering together of the best of these in the southern metropolis will give an impetus to the industry and attract attention to its importance and advertise the live stock possibilities in a way which will be most beneficial.

UNIONISM RAMPANT.

Trade unionism seems to have reached the limit in Australia where its hold upon politics is such that it has prevented the introduction of a virus, or disease, for the rabbit which infests that section. The claim is openly put up that if successful, this invention or discovery of Pasteur would deprive many working people of their avocation. This industry of killing rabbits has become so extensive that a regular guild or organization exists amongst those engaged in it, and the cost to farmers of Australia to employ these men to rid their counties of the rabbits has been a great drain upon resources. Now the pressure has become so strong to retain the employment of these men that it is thought that the vastly cheaper method will be barred from introduction.

GATHERS IN THE BUGS.

George Compere, who has traveled over the world for several years in search of insects which will prey upon the injurious insects affecting the agricultural industries of this State under direction State Board of Horticulture, has just returned from across the Pacific, his last stop being Japan. He brought with him a number of parasites which are supposed to destroy the mealy bug and the purple scale. The mealy bug has proved one of our most difficult pests to contend with, and it is sincerely to be hoped that the "bug to eat the bug" will succeed.

It is announced that Mr. Compere will remain with the Horticultural Commission and continue his search for beneficial insects.

The planting of eucalyptus may be more or less of a fad in the interest which it is now manifesting in this State, but it is a good one. It is possible many will plant unwisely and upon land which will prove it to be unprofitable. We trust, however, on the whole, it will prove exceptionally profitable to this State.

California poultrymen are continually asking themselves the question: "Why are we shipping to this market products of Middle Western farms over 2000 miles away?" San Francisco and Los Angeles pass scarcely a day without the receipt of a car of either poultry or eggs. We do not know any satisfactory answer to the question.

"DIRTIES."

We recently noted in quotations of th egg market of a city in this State where fresl ranch eggs were quoted at 21½ cents, the nex line below the fresh ranch was dittoed, immediately after which was "dirties 17½ cents." W don't think any moral is necessary on such a quotation, other than to call attention to the fact tha eggs are not the only "dirties" that are sometimes placed upon the market. Several packin houses of California have an embarrassment along the same line in the smutty frui which is brought in. Potatoes, celery, all kind of fruit; in fact, every product of this State ar against the same proposition.

Let us market less "dirties."

OUR INLAND WATER WAYS.

When our inland water ways shall be improved, as appears to be a possibility in th near future, we will solve an important proble in our transportation problem, the problem cheaper rates for our products.

Members of Congress and others in hig authority are beginning to see that impro means of transportation are badly needed. Th President, sometime ago, urged upon his count men the importance of conserving and improv our inland waterways, and Senator Knox, in recent speech, told his hearers that the key our future prosperity is in the development of river, lake and canal facilities. Along the s line is a bill recently introduced in Congress Representative Currier, of New Hampshire provide for the creation of a National Highw Commission and for the construction, impro ment and maintenance of public highways. bill proposes the expenditure within the next fi years of the sum of $50,000,000 at the rate $10,000,000 a year apportioned to the States the ratio of $500,000 to each State, to be exp ed at the rate of not less than $100,000 a yea

Fifty years ago our inland rivers were t great avenues of transportation and they aff ed ample facilities, for those days, for our land country. The advent of the railways the rivers "out of commissiou," so to speak now the need of a natural competitive system keenly felt and the probability is, that with ten years, the now discarded waterways teem with commercial importance and solve a great degree the question of cheaper tr portation for our farm products.

The 60th congress will soon close, and to d with the record that it will reach the billion d mark. Its appropriations, it is estimated, aggregate $1,026,000,000. It is estimated that revenue will bring to the treasury during same period covered by the appropriations an gregate of between $850,000,000 and $900,000,0

The total of $11,400,000, not counting the manent appropriation, is the total of the cultural bill passed by the House of Repre tatives.

Central California

Orchard laborers are scarce at Turlock.

Tres Pinos will produce about 7000 tons of hay.

Lindsay shipped nearly 1000 cars of oranges to date.

Turlock is discussing an unfermented grape juice factory.

Butter and cheese of this State sold last year for $13,500,000.

A Santa Cruz farmer was recently gored to death by a pet bull.

The orange packing houses of Lindsay are working on Valencias.

Watsonville has a special berry train into San Francisco every day.

Hollister hay balers are already at work with the baling, price being $1.60 per ton.

The Farmland colony near Tulare will soon receive a supply of irrigation water.

Packers are rapidly buying up the coming apple crop of the Watsonville orchardists.

The cool weather of the spring has not been favorable to developing the best growth of grapes.

Much of the barley crop in the San Joaquin valley is going to give an exceptionally good crop.

The next meeting of the Tulare Grange is to discuss the question of co-operative marketing.

The grape crop in the Lodi district is in good condition and promises an immense output.

Stockton potatoes were seriously injured by frost on the morning of May 16th. Some were killed.

A fiend at Porterville entered the fine orange groves and completely girdled 30 fine, large orange trees.

Late frosts this spring are found to have done much damage to vineyards over the San Joaquin Valley.

Cherry growers near Stockton are refusing to contract their crop, preferring to take the chances of the market.

An Artesian well has been sunk near Summit Lake to a depth of 1100 feet, and is now giving a fine flow of water.

Eastern capitalists are attracted by the possibilities of eucalyptus culture, and are looking up land in the San Joaquin Valley.

The State Grange is contemplating the gathering of the crop statistics which shall be for the use of all grangers of this State.

Cherries are going forward at a good rate from San Jose. The black Tartarians are yielding a fairly good crop, while Royal Annes will give a light yield.

Grain is coming in so finely in the section about Hollister that the crop of hay will be much lighter than anticipated. Many ranchers will allow to stand and produce grain.

Tulare county had one of the most disastrous grass fires, when a strip of country nearly ten miles wide and 36 miles long was burned over. Many stacks of hay and barns were burned.

Arthur Briggs, president of the California State Board of Trade, has gone to Oklahoma, the legislature of which is endeavoring to enact a law prohibiting the shipping in of sulphured fruit.

Southern California

The grain harvest in Imperial valley began nearly two weeks ago.

Oxnard sugar factory will handle the output of about 15,000 acres this year.

About 100 cars of oranges are going forward daily from all points in the State.

Cattle fattened in the Imperial valley are now largely supplying Los Angeles shops.

Apricots are growing finely and indicate now the biggest crop produced in many years.

It is claimed that Imperial valley can market 130,000 hogs within the next six months.

The cantaloupe crop of Imperial valley is estimated 1500 carloads from about 5000 acres.

Southern California will receive approximately $4,000,000 from sugar beets this season.

The promise is for one of the biggest walnut crops ever given to the southern end of the State.

Garden Grove is sending out a large quantity of new potatoes, which is netting the growers large sums.

Five hundred to 750 school boys of Los Angeles are going to Imperial to assist in the cantaloupe harvest.

Much labor has been rushed into the Coachella and Imperial valleys and even yet the call is for more.

Navels are practically all shipped and Valencias are in full swing at all Southern California shipping points.

Over 100 date trees are blossoming at the Mecca Experimental Station. Important results are expected from this year's growth.

The Los Angeles office of the Weather Forecasting Service is to detail a man after July 1st to study Salton Sea evaporation.

With melons going out of the Imperial valley before the middle of the month of May, it claims it is the earliest melon shipper of the world.

The Southern California Sugar Company has just organized at Santa Ana and elected its Board of Directors. The company is capitalized at $600,000.

Many sheep are being marketed because of shortage of pasture, while sheep raisers in the Imperial valley are holding for better prices after the feeding season is on.

While the melon crop of Imperial valley will be much smaller than at first anticipated, it will still be an immense crop. The first melons commanded $1.00 each in Chicago.

Dairymen of Artesia are much dissatisfied with prices secured, and are organizing a Southern California Dairy Association with capital stock of $100,000, and announce that they will fight the milk trust.

The hay crop of the mesa east of Riverside promises to be exceptionally fine this year. The Riverside Press says that hay which five weeks ago was only 8 inches high became rank and tall owing to the late rains before time of cutting.

A new corporation has been organized at San Fernando and will build a house for storing and packing of lemons. The incorporators are: C. C. Reynolds, J. A. Reid, R. H. Wilkerson, H. E. Huff, H. E. Bartlett, C. D. Hubbard and T. J. Walker.

The Coast

June 4th will be annual berry celebration at Milton, Oregon.

Farmers of Nez Perce, Idaho, have contracted for 450,000 grain sacks.

The Dalles, following the example of Salem, will have a cherry show this year.

Fruit will be much lighter crop in Utah owing to prevalence of late frosts.

A steady 24-hour rain gladdened the hearts of farmers of Oakesdale, Washington.

Large tracts of land in Washington are being subdivided into smaller ranches.

Cattle men of Eastern Oregon have been banded together in lawless acts of cutting wire fences.

A steady decline in wool is noted in the Seattle wool market. 8 to 10 cents is now the general quotation.

Midsummer meeting of the State Horticultural Society will be held at Dalles, Oregon, June 20th and July 2d.

Washington State College at Pullman has arranged for two series of farmers' institutes in Western Washington.

The heavy downpour of rain near Goldendale, Washington, about the middle of the month insured an immense crop of wheat.

Sugar beets are now nicely up in many of the Colorado beet fields and local report has it that "the rows may already be followed."

The State University Experiment Station of Idaho is going to have a demonstration train to visit the various farming sections.

The Spokesman Review of Spokane is conducting a strong campaign to induce every farmer in the State to secure a name for his ranch.

The arid farmer of Utah has been greatly encouraged by the later showers, which have turned his apparent failure into a complete success.

Grain farmers at Wenatchee, Washington, have organized the Quincy Farmers' Elevator Company and will commence at once the construction of an elevator.

Farmers in Washington are rebelling at the fact that British Columbia is importing Australian butter and feel that that trade should be kept on the Pacific Coast.

At the Interstate Commerce Commission hearing at Washington it was testified that the Northern Pacific Railway nets $2.10 on each ton of wheat handled.

The drouth of April seriously injured the beet crop of Utah, which was later saved by showers which germinated the seed and a fair output is now promised.

The great wheat producing section of Eastern Oregon has been visited by experts from the Oregon Agricultural Experiment Station, who hope to suggest plans for diversified farming.

At a meeting of the wholesale produce dealers of Portland, Oregon, steps were taken to give more considerate treatment to shippers of eggs to that market. It now appears that the commission method of handling eggs is such that producers and country dealers refuse to ship there so far as possible.

POULTRY AT PETALUMA.

THE article "Poultry in Petaluma," by Mr. Henry Langeuschuodt, former poultryman of Montana Experiment Station, will be read with much interest by our readers. We hope that this article will stimulate the industry in other sections until Petaluma will have a rival.

Petaluma is in Sonoma county, which has an association called the Sonoma County Co-operative Poultry Association, the object of which is to protect its members from the unscrupulous commission men. They have been compelled to establish their own market in San Francisco. In explaining the reason for this the manager, Mr. Wm. F. Schultz said:

"We learned that the commission men engaged in handling our product were giving the retail trade to understand that the existing high quotations for eggs was due to our establishing of our own packing-houses in Santa Rosa and Petaluma. This is false and we decided to enter the San Francisco market and establish our own selling price, regardless of the manipulation practiced on the San Francisco Dairy Exchange.

"It will be recalled that last January the Exchange 'broke' the market, and afterward accused the retail trade of maintaining an unnecessarily high figure. It now happens that the same exchange is making quotations utterly at variance with the season's trade conditions. This has proved a hardship for the retail distributors, who have been forced to advance their prices on the consumers, while at the same time the blame has been placed on the producers. The latter have associated themselves for no other purpose than to protect themselves against the power of the Exchange.

"We are absolutely opposed to the jockeying which is practiced by the Dairy Exchange. We desire that the retail trade should understand that all we ask is a fair price for our product, and that we shall not submit to the domination of a false quotation made by a set of dealers, and we propose to establish a quotation which will be based fairly on the conditions of supply and demand."

Mr. Langeuschuodt's letter follows:

A poultryman visiting Petaluma, whether he is from another State or within this, cannot help finding many interesting things there. Indications of the nature and size of the prevailing industry will engage his attention almost from the time he steps from the train. He will notice the familiar egg case on express wagons and piled up on sidewalks of commission houses as he goes to the hotel.

Magnitude.

There were shipped from Petaluma during the year 1907 almost 4,500,000 dozen eggs and over 59,000 dozen poultry. Other points in same county, (Sonoma) shipped 1,750,000 dozen eggs, bringing the total of the county over six million dozen. Make comparison with these figures of product in whole State 14,000,000 dozen, it is said to be, we believe.

What has attracted this industry
here, is a question the writer
not wish to take up, but

secure better chicks than the average poultryman is able to hatch even with the best machines. They are finding this out here and many have discontinued using their machines. The brooding of chicks can be made another branch, and is. You will find some that do nothing but raise the chicks to three or four months old, finding ready sale for them, both pullets and cockerels.

Sometimes crude methods are found to be used. Mostly they are ready to adopt methods that will lessen the labor and give greater returns. You will find much that is interesting, especially if you happen to visit here in hatching season.

* * *

AROUND THE YARDS.

Fat hens are not good layers.

* * *

Protein foods are egg-producing foods.

* * *

From 40 to 50 ducks our allowed in one pen.

* * *

Buttermilk is good for poultry and they seldom tire of it.

* * *

Ducklings are marketed at 5 pounds weight, which they should attain at ten weeks.

* * *

Young ducks should be fed powdered charcoal in their food about once a week.

* * *

Vegetables are better fed raw than cooked to laying stock, as they are not so fattening.

* * *

Watch the male birds, don't allow them to get thin and run down or your eggs will not be fertile.

* * *

Filth and lice are the young turkeys, worst foes. Keep the coop clean and the little fellows free from lice.

* * *

Whitewash the houses; it is good vermin destroyer; makes the houses look nice and fresh and is cheap.

* * *

Lettuce, rape, collards, turnips or, in fact, any kind of green stuff supplied to the laying hens now, while grass and most natural green stuff is scarce, means more fertile eggs and more in general. Give the fowls the run of the orchard, if possible. They will thus not only reduce the number of insects that will prey on the trees and fruit in the summer and spring, but will help keep the feed bill lower; also keep the fowls more vigorous and busy.

* * *

Raising Geese.

I have never seen anything in the Cultivator about raising geese, and as I am a beginner I would like to know what to feed and how to care for little goslings.—A Subscriber, San Fernando.

Goslings, like chicks, should not be fed until 24 to 36 hours. Then they should be fed four times daily. Feed, by measure, one part bran, one part rolled oats, cornmeal and shorts one part; four beef scrap, one teaspoonful to a quart of food. Green food, grit and water must be kept always before them. After ten days to two weeks old add one tablespoonful fine beef scrap, and give cornmeal and chopped vegetables mixed with skim milk or water. Don't give water to swim in till full feathered.

* * *

Exercise.

I have a large Buff Wyandotte hen setting, whose time will be up day after tomorrow; she seemed perfectly well and happy until last evening when I let her off at the regular

time to eat and drink. When I opened her box instead of coming off as usual, I had to take her off and when I put her on the ground she couldn't stand up. Her legs seemed too weak to hold her up and she staggered around like she was drunk. When she first came off she could hardly stand up, but the longer she stayed off the stronger her legs seemed to grow. She ate and drank as usual, clucked and scolded and fluttered her wings; indeed, seemed to act quite natural except that she had such poor use of her legs. She went back onto her nest but wabbled about so she could hardly get into the door of the box.—Gladys A. Veall. Dehesa.

The trouble with your hen might be caused by one of or several things. First, she may have set too close and not had enough exercise. Then we have known them to act this way after a good dusting with a lice powder. When the powder is real strong it seems to make them drunk and unable to stand. We have also seen them so weak from lice that they could not stand. Perhaps if you will watch you can tell what ails her; we think it some local trouble more than a disease.

* * *

Possibly Head Lice.

My chicks are about three weeks old and doing very nicely and grow, and are apparently healthy, and always hungry. But every now and then one gets blind in one eye and droops and sits around three or four days and then dies. I feed them dry bread crust crumbs with a little curdled milk, and sometimes a little of bran and cornmeal and some small wheat.—A Subscriber.

Your chicks act as though troubled with head lice. We would anoint the head and eye well at night with carbolated vaseline.

FLEAS, LICE, TICKS, MITES.

Every living thing has its own particular vermin, both internal and external, and possibly poultry, of all creatures, have the greatest number and variety. It is claimed by some writers that a few vermin on ordinary healthy fowls in no way effect their health, it being when such multiply exceedingly that they do the harm; and when such time arrives it most frequently happens the host, if a chicken, has become so emaciated from their effects that the application of remedial measures but hasten death, again showing that parasitic troubles are just like diseases—prevention, in every instance, is better than cure, i.e., clean fowls can be easily kept clean, while the internal and external parasites, when but few, can be easily exterminated.

Some scientists tell us that external vermin on domesticated fowls reach upwards of a score of varieties; others about half that number. Some make two groups of them, lice and mites; the definition of others is lice, mites, ticks and fleas.

All lice are what is known as pennivorous, that is, livng on the feathers and outer scales of the skin, but not puncturing the integument in search of their natural food; the damage they do is, therefore, not nearly so severe as is the case with the blood suckers.

Some of the parasites—all lice and some mites—live permanently on their hosts, while others—fleas, some mites, and ticks—go to and fro. Some live entirely upon the skin, dee amongst and at the root of the feath- ers; some live like ticks, with thei heads against the skin, and their bod- ies erect; while another sort live be- tween the barbs of the feathers an all are encouraged to live by dirt The poultry flea is abundant in dirt fowl runs particularly.

One Acre or More $350 to $500 Per Acre
One Quarter Cash Balance Long Time

Poultry Raising on the Cudahy Ranch

Poultry raising on the Cudahy Ranch is a demonstrated success. The soil is ideal—light and free from "hardpan"—ensuring healthy, well matured birds—and a maximum egg production. Feed is cheap—and most of it can be raised on the ranch. Markets for eggs and poultry are but twenty minutes away—on the Whittier Electric Line, the Southern Pacific and Salt Lake Railroads.

Cudahy Ranch Lands range from $350 to $500 per acre; terms, 1-4 cash, balance long time.

Free water in abundance—deeded with the property.

You can buy one acre or as much as you want—every bit of the great 2800-acre Cudahy Ranch is superb poultry land.

Mr. W. W. Howard, one of the foremost White Leghorn authorities in America, thinks so highly of the Cudahy Ranch for Poultry Farming that he has established his model farm there.

No matter whether you are expert or novice, you'll do well to follow Mr. Howard, a man who has made a splendid success of poultry raising.

Call or write for facts, or, better still, go down to the ranch and study the proposition at first hand. Whittier cars leave on the even hour from the P. E. Building at 6th & Main streets, Los Angeles.

General Agriculture

FOR ALASKA-YUKON.

J. A. Filcher, secretary of the State Agricultural Society, and also representative of the governor for the Alaska-Youkon Exposition, which opens in Seattle next spring, is holding out a fascinating offer to counties and other prospective exhibitors which ought to result in an unusually fine showing at the State Fair this fall and the assembling of a lot of good exhibtion material for Seattle. It is really an offer to the different communities and manufacturers to participate in two expositions at less than the usual cost of one. He says to the counties and others who want to be represented as Seattle they may get their exhibits ready and send them to the State Fair. Then at the close of the Fair, he will take charge of them, so far as they are suitable, and pack them and store them and finally ship them to Seattle and install them neatly in the California building. In other words, the proposition implies briefly to get California's exhibit for Seattle together this summer, so far as practical, and assemble it and show it to our own people and our visitors before it goes north. All goods intended for Seattle have to be assembled in any event at some central point in California before going forward in carload lots, and this plan affords a rare opportunity to make double use of them and draw double prizes on them without additional expense to the exhibitor.

A LIVE STOCK SHOW.

Why not have a live stock show in Los Angeles next January?

The Live Stock and Dairy Journal edited by Dr. Charles Blemer, ex-State Veterinarian, recently contained an editorial advocating the holding of a stock snow during the convention of the National Live Stock Association in January 1909. This assembly will bring together in Los Angeles the most prominent breeders from all parts of the United States and Canada.

This convention has always met in the East—Denver, St. Louis, Chicago and such places—and a stock show has nearly always been a feature.

If any start has been made in this direction as yet, I have not heard of it except the recommendation by the above paper published in the northern part of the State.

It farther stated that it had assurance from a number of breeders in the San Joaquin and Sacramento valleys, that they would gladly make exhibits.

Now, an enterprise like this will take organization and work which must be done in this part of the State. It must have the backing and endorsement of the Chamber of Commerce and the Mercnants' and Manufacturers' Association.

Agricultural Park belongs to the city and it is perfectly adapted for such a show without any extra expense in fitting it up. The thing to do is for some one like the Cultivator to call a meeting of all interested parties to meet in the hall at the Chamber of Commerce some time in the near future, organize and set the ball rolling. There is no time to be lost as such things always drag.

The Imperial valley held a stock show a few months ago and it was such a success that it is to be a yearly event.

That country is filling up with the best stock procurable, and they could be depended upon for a good exhibit.

Now, let's hear from all interested parties what they think about it and any suggestions that may be made, should be sent in.

Let us get together for an exhibition of high bred stock.—R. T. Whittlesey, V. S., Los Angeles.

Cream Separators, all sizes, all prices. O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

FRUIT AND PURE FOOD LAW.

Continued from page 619.

partment, and that producers and distributors from the knowledge thus gained, could act in future with intelligence. It is a disappointment that no information has been given out in reference to these examinations.

Another effort was made early in the present year to obtain a modification of, or amendment to, Decision 76, in order that fruit drying, preparing it for market and the distribution might be pursued with safety on a practical basis. This renewed effort was made necessary because producers were unable to guarantee that the product cured by them would come within the limit prescribed in Decision 76, and buyers were unwilling to stand in the breach between producers and distributing merchants. The burden of responsibility rested on producers and they did not feel able to bear it. They claimed that fruit of the color and quality required for consumption could not be produced in this State, which did not show on chemical examination, if the test was made while in the raw state, an excess of sulphur dioxide, over 35-1000 of one per cent. The unit fixed by Decision 76 was, in their opinion and in the opinion of distributors, prohibitive.

The Department of Agriculture appreciating the situation as it was presented to Secretary Wilson, issued a new decision on February 28th, this year, known as "Food Inspection Decision 89" as an amendment to Decision 76, the full text of which may be interesting:

"The question of the addition to tood of minute quantities of benzoate of soda and of sulphur dioxide, will be certified immediately by the Secretary of Agriculture to the Referee Board of consulting scientific experts.

"Pending determination by the Referee Board of the wholesomeness or unwholesomeness of these substances, their use will be allowed under the following restrictions:

"Benzoate of soda, in quantities not exceeding one-tenth of one per cent, may be added to those foods in which generally heretofore it has been so used. The addition of benzoate of soda shall be plainly stated upon the label of each package of such food.

"No objection will be made to foods which contain the ordinary quantities of sulphur dioxide if the fact that such foods have been so prepared is plainly stated upon the label of each package.

"An abnormal quantity of sulphur dioxide placed in food for the purpose of marketing an excessive moisture content will be regarded as fraudulent adulteration under the Food and Drugs Act of June 30th, 1906, and will be preceded against accordingly.

"Food Inspection Decision No. 76, issued July 13, 1907, is hereby amended accordingly."

Continued next week.

Sonoma County Pomona Grange recently held an all-day session at Geyserville. The next session is to be held at Sebastopol.

Live Stock and Dai

CORN.

THE selection of the seed of the Indian corn, from developed productive plants, has become an established industry. One must see the corn growing to realize the difference between corn from seed without good ancestry and that from selected parentage. The increased growth is noticeable from the first day the green blades peep out of the brown earth. The increased broadness and deeper green of the tiny blades, the increased height and vigor of the full grown plant is all marked to even a casual observer. It is wonderful to compare it with nearby corn fields; it grows much faster; it seems to simply walk away from them.

Culture.

The land for the corn field, planted with pedigreed corn this year, was irrigated by flooding, well soaked, check by check. The plows follow as soon as possible to turn the land over, harrows followed the plows and wherever there were any clods formed the disc was run over them. As fast as a check was plowed and harrowed it was seeded with the corn planter in rows three feet apart. Each piece was completed at once and the corn had only to start to grow. It is hardest work to correct the tendency among the men the idea that farming in big pieces is necessary In the farming of a large place the farming must be in detail, not in general, then returns will come in for all labor expended.

Too Much Land.

Beginning with the crop, as an example. Sending in the Chinamen to irrigate first as soon as the land is ready one check at a time; plow, harrow and sow it at once. As fast as possible arrange the teams that they will follow right along with the work. If a single check has only two acres in it finish it before leaving it. Cultivate the habit on the ranch of completing each little piece. The whole will be perfect only as each little piece is well done. It is a poor way to wait until eighty or a hundred acres are all plowed and harrowed before seeding. Seeding should follow closely and not be over a day behind the harrowing. If rains or strikes or sick horses come to hold back the work, only the few trees the plows are ahead are paid for without returns. All losses are minimized if each piece of work is completed while it is in hand. Well done and completed quickly, each portion of the field should be the idea.

Pedigreeing of Corn.

The corn with a pedigree for goodness and thrift, is worth three times the price paid for the seed. It doubles and thribles the crop of corn and increases many times the weight of the leaves and stalks. Corn is unlike wheat or the cereal generally in that it is very sensitive to inbreeding. Seed corn grown on a place year after year without any new corn being purchased will run itself out. Bringing in seed from new localities must, therefore, be constantly resorted to. If we always brought in the improved forms and would sow the seeds mixed we would be able to use the seed the next two years; then we could add some more new seed. This way will keep the corn strong and th
is necessary to be sure the n
is as good as the old.

The Moisture.

Planting corn is only the b
of the work; the life of the c
cultivation. Every inch of
must be gone over and
least every three weeks;

iting advertisers, mention Cultivator.

not master the colt, better get help or sell him unbroken before taking the chances of spoiling him and thus making him so much harder to conquer. The ideal way is to begin with the little fellow while yet weak and establish your mastery. Keep at it until he is old enough to hitch, and the breaking will be easy. Establish the kind of fear that will keep him from violating your commands or disregarding your authority, but not the kind of fright that will cause him to flee at sight of you and make it necessary to corner him in order to halter him. I have seen men in charge of a bunch of colts who were so brutal to the little fellows that a comfortable box stall and plenty of good feed would not induce them to "run the gauntlet" of passing their keeper.

While I am always sorry to see any kind of animal abused, it is true I have had a few colts to break that had come to that point where it seemed that only a good sound whipping would reduce them to subjection. Kindness and coaxing might have accomplished the work in time, but men do not like to pay the trainer for coaxing and petting their colts into submission when it seems like an endless job. Whenever a horse is not tractable and not easily broken or shows a disposition to be headstrong and mean, he must be brought under subjection by some method before he can be considered safe.—H. C. P.

OVERCOMING IGNORANCE.

The dense ignorance and the superstition of the native farmer of the Philippines and the task before the American who would teach him better, is illustrated by the following from the Philippine Agricultural Review:

The Bureau of Agriculture has continued to furnish American stallions, jacks, bulls and boars for breeding purposes in the provinces. In many cases the number of services rendered by these animals has not been as large as could reasonably be expected. This fact has been due to several different causes, among which are the following: There is a notable lack of appreciation of the value of better blood. In some cases horses stationed in the best horse-breeding districts have had practically no service, while hundreds of mares in easy reach were running at large with a herd of horses containing numerous native stallions of all ages and qualities. In many cases the native owner of mares does not even take the pains to breed them to the best native ponies. During the year 11 stallions and 2 jacks have rendered 228 services. Of these, 1 Arabian stallion in a remote mountain district has served 62 mares, 2 in charge of the Bureau have served 75, and the remaining 10 have served only 91, or an average of only a little over 9 each.

The groundless fear that native mares would not foal colts sired by larger horses has also continued to exert a bad influence. In other cases horses have been loaned to private parties whose interest in their use did not extend beyond the breeding of their own animals, and under such circumstances no effort has been made to secure outside mares to be bred. There have also been circulated various rumors, such as the charging of extortionate stud fees or the taking of part of the colts by the man having the horse in charge, all of which, no doubt, have had their influence in deterring those who might otherwise have patronized the horses.

THE
Cream Separator
CREAMERYMEN
USE

Today over 98 per cent. of the world's creameries use DE LAVAL separators. This fact means much to every cow owner. Without the separator creamery operation would be almost impossible. No matter whether the creamery is buying whole milk or cream its success rests upon the centrifugal cream separator. Those who are buying whole milk skim it at the factory with DE LAVAL Power machines—those who are buying cream advise their patrons to purchase DE LAVAL Hand machines. The biggest and most successful creamery company in the world is buying cream from nearly 50,000 patrons to whom it has sold or recommended DE LAVAL Hand machines, after many years of experience with all kinds of separators. Had the DE LAVAL not been the best and by far the most profitable separator for any one owning two or more cows, this great creamery would never have taken the responsibility of placing them with its patrons. And this is true in hundreds of other instances, for creameries can be found in every part of the world having from a few hundred to many thousand DE LAVAL patrons. Wouldn't it pay you to find out WHY experienced creamery men prefer the DE LAVAL to other separators? You may learn the reason by asking for a DE LAVAL catalog, or better still, a DE LAVAL machine—to examine and try out at your own home free of all expense. Don't wait, but write us today.

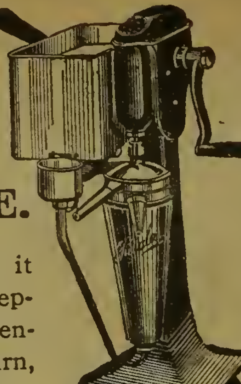
Geo. A. Smith, Corcoran, Cal.



The Name "Tubular" on a Cream Separator Stands for the Same as "Sterling" on Silver—THE BEST MADE.

What the Tubular does in the dairy puts it foremost—twice as clean separating as other separators at Fairmont, Minn.; twice as clean at Kendall, Wis.; six to ten times as clean at Scotsburn, N. S.; fifteen times as clean at Gananoque, Ont.

But these competitions were far away from your home. Well, try it out in your own dairy, and see whether the Tubular is sterling, whether it will do better for you, with your own cows, than any other process or separator. No cost to you. Just write us you want to know what the Tubular can do for you. Ask first for Catalogue No. 260. It's a good introduction.

Queries and Replie

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Rabbit Breeding.

The query of the New Subscriber in regard to White rabbits published in your last issue brings to my mind my years of practical experience with Belgian hares.

Male and female should never be left together after mating. We never left two or more animals in a pen after maturity, always separating the sexes when weaned and put each animal in a separate pen when breeding time arrived. Each doe should be provided shortly after mating with a nest box, with opening large enough to admit the mother easily. This opening should face the wall of the pen so as to exclude light and observation. It is well to have the top of the box removable in order to examine the litter a day or two after kindling. The mother should be provided plenty of straw or fine hay and allowed to build her own nest without molestation; as the time of kindling approaches see that she has plenty of clean drinking water and let her alone.

Does eat their young because they are frenzied with thirst or annoyed by curious meddlers.

We bred hares on a large scale and never had a single case of infanticide. Any further information at my command will be cheerfully given.—Bee Josephine O'Mealey, Anderson.

We think the above answers our Chino subscriber fully, and the Anderson subscriber's courtesy and help is appreciated. Anderson and Chino are several hundred miles apart, but t get close together in the Cultivator

Dewberries.

Would you kindly tell me how transplant the early dewberries? I can I tell the plants apart? I h been told unless every third plan a male plant they will not produc good crop. Are plants procured f the vines being covered the sam the other dewberry?

Why does my cabbage go to seed stead of being a firm head?—A R er, Charter Oak.

I do not know what is meant by "early" dewberry. We know no riety of that name. So far as I k all dewberries have perfect blo and there is, therefore, no nec for planting in the way sug Dewberries are propagated from root cuttings or by layerin tips. From January 1st to Marc is the best time to plant them ou

Several things may cause your bage to run to seed instead of hea up solid. An inferior quality of may cause it, and if through ne or any cause they become stunted ing their growth it may act as a p of rest and when started into g again by liberal watering or favorable atmospheric condition, run to seed instead of headin solid. The secret of successful bage growing is to have good see fertile soil and never allow the to have any severe check in g from start to finish.—Q. A. L.

Barren Satsuma Plum.

We have a fine, vigorous S plum tree set six years ago. It blooms profusely, but has never a plum. Is it lack of pollinati have other plums but they bloo than the Satsuma.—Subscribe mont.

Graft one-third of the tree to son and another third to Kelsey and you will have three of t Japanese plums in existence. T of the tree that will remain S will no doubt bear with the o varieties to cross pollinate there are some specimens of S that are always light bear other two varieties will give y fruit that ripens early and late. All three are good plums for home use though n mand by canners.

SEND FOR CATALOGUE. **THE TEMPLE PUMP CO., Mfrs., Meagher and 15th Sts., Chicago.** THIS IS OUR FIFTY-FIFTH YEAR.

e Southern Pacific railroad track is at which is termed the Antelope lley. Lancaster, the center of the lley, or the principal town of the lley, has an altitude of 2348 feet. climate is much like that of other uthern California points excepting at the high range between it and e ocean cuts off to a certain extent e tempering sea breezes, and occanally it is given a touch of frost. any of our Antelope valley subribers should ask as to Macdoel, may say that it is one of the newer stoffices of the State and is up in kiyou county.

ied Olives.

Can you tell us how to dry olives; o, how to make olive oil at home? G. M.

We cannot give information as to ing olives other than simply to out and dry in the natural, bitter te. The writer has cured them in t way, and, while quite bitter, they ord a pleasing relish for a picnic ch. If any subscriber has had exience in curing them by removing bitter before drying, our subiber will appreciate the informaa. Olive oil production is most too nplicated and requires too powerful ress to be practicable in home protion.

es.

Please tell me how to keep flies n a door; also from a cow's back. L. K., Colton.

uhach is the best remedy we know to keep the flies from inhabiting ook near the door. If a door is t so as to have free sweep of the d underneath the porch, flies will cely ever remain around it.

ealers usually keep the fly repell- compounds which are usually ely made of fish oil which, sprayed the cows, prevent the annoyance. better, perhaps, is a cheap barsack blanket so made so as to tie the cow's back. Flies may be ely suppressed by thorough cleans about stables, which is their ding place. Manure piles and , especially, giving opportunity their increase.

ing Mammoths.

ease give me the manner of prun- Mammoth blackberries. My often grow to the length of 20 feet, and I have been told that canes should be restricted to two hree to each hill. Should these s be topped to make them branch give more fruit wood, or is it best t them go the full length and sus- on trellis. Also will appreciate ral culture directions.—J. J. Penton, La Canyada.

have not grown the Mammoth berry nor have I seen it grown, must, therefore, confess my iny to advise as to method of cul- and pruning. On general princi- I should shorten in such ram- growth—say to 6 or 8 feet—I t the variety is the Oregon reen instead of the true mam- I have grown the former, and I could get canes 25 to 30 n length, I could get no fruit. I knew any one to succeed in g it so far south.—Q. A. L.

on Trees.

se give treatment for green- ungus or moss which grows on es of orange trees. They are ackward of growth.

well to plant second crop of es where potatoes were dug t of May?—E. B. W., San Di-

The moss on orange trees indicates a very low condition and should be corrected by scrubbing the trees with fairly strong lye solution and putting the tree in a much better condition by a more thorough cultivation and by fertilization. If they were deciduous trees, when they are dormant spraying with sulphur and lime would be the treatment. The planting of potatoes on the same ground would probably be all right if other ground is not at command, though probably better results would be secured on new land. However, not more than a couple or at most three crops should be grown without rotation.

San Jose Scale.

I am sending under cover twigs from apple tree. Please give disease and remedy.—Old Subscriber, Santa Ana.

This is a thorough infestation of San Jose scale. One of the worst we have seen in several years. Spray now with rosin wash or wait until the trees are dormant, then spray with salt, sulphur and lime.

Bermuda in Alfalfa.

What is the best and most effective metnod of destroying Bermuda in alfalfa. Also, how can I kill arrowweed and wild asparagus? How can I destroy red ants.—J. C., Imperial.

The only effective way to destroy Bermuda grass in alfalfa is to plow under deeply and raise some crop on that ground which will give it clean culture for a couple of years. Arrowweed we cannot answer as to how it may be killed, and will ask any of our Imperial valley subscribers, who have had experience, to give suggestions along that line.

Carbon bisulphide is probably the best to kill ants in large quantities. It may be poured down the holes and the opening covered with wet dirt. In a small way where there are pests around the house California Buhach, while it will not kill them will easily drive them away.

Melon Aphis.

Is there any effective means of destroying aphis on melons? A friend handed me a clipping taken from a Northern California paper in which a certain species of Japanese bamboo was described, the article claiming that actual tests showed a growth of 5½ inches in 4 hours. Do you give any credence to the story, and if there is such a plant where may one secure a start of the same?—W. O. S.

Spray with an emulsion of coal oil. Make strong, hot soap suds and to five gallons add, say, a pint to a quart of kerosene and churn it or pump it through tht spray pump until thoroughly mixed and milky.

The bamboo story may be true. We never saw such growth, but are assured that the Japanese Giant bamboo will readily grow six inches in 24 hours. Most of this growth is through the middle of the day. Most nurserymen keep the plants.

Veterinary

Dr. R. T. Whittlesey, veterinarian, of 714 East Seventh street, Los Angeles, will answer questions in this department. In writing of sickness or injury to any animal be explicit in giving symptoms and particulars. Always enclose full name and address, but if assumed name or initials are preferred they will be used.

If an immediate mail reply is wished enclose $1.00 for such service, but for replies in paper only, no charge is made if the answer will be of general interest.

A Blister.

Please tell me through your paper what to do for a deep blister on a horse's neck, just in front of the collar; have been using "Quins' Ointment" which, where applied, brings out a yellow water, but does not cure. Sometimes it is very soft, and at others it gets hard. We do not know what caused it, as we always use a collar pad.—A Subscriber, Redlands.

I do not understand what you mean by a "deep blister." If it contans puss or fluid of any kind, it should be opened and then treated as an open wound. If there is a hard tumor it should be cut out.

Inflammation of the Bowels.

I had a horse take sick in the morning about 7 o'clock with what appeared to be colic. He was not bloated, but he rolled and seemed to be in great pain. I gave him Perry Davis pain killer and soda, but it seemed to make him worse. He began to bloat and suffer a great deal. Gave him another dose, but did not relieve him any. He passed water all right and about noon his bowels moved. Still kept bloating and couldn't lie down; couldn't make him move out of his tracks only by turning him around and then he could only slide his feet. He seemed to be stupid like, slobbered a good deal, breath very short. I had the horse three years and never had any trouble of any kind before; was eight years old; was feeding oat hay, but the night before gave about a gallon of shorts. About 8 o'clock p. m. he fell down and lay about half an hour and then died. Can you tell me what the trouble was through your paper?—S. O., Corralitos.

Inflammation of the bowels. Should like to know if you drenched him through the nose as I suspect.

Obstruction in Teat.

My cow gradually quit giving milk from one teat, and now does not give any milk at all from that teat. There is milk in the teat but it seems that the valve is closed and will not open to let the milk out, as that quarter of her udder is full after she is milked. It is not the garget, as the milk was all right and perfectly healthy as long as she gave milk from that teat. The whole udder is healthy.—Mrs. M., Los Palos.

The teat should be opened with trocar and a bistoury made for the purpose. Then introduce a self-retaining milk tube and keep it in all the time until the hole through the valve is healed. You had best call in a veterinarian, however, unless you want lots of trouble.

Classified Liners

Rates 1½ cents per word per issue. No ad accepted for less than 25 cents. Our classified columns are the clearing house for the readers of the Cultivator. Here you can insert an ad for the small sum of 1½ cents per word per issue, and be sure that it will be read by thousands.

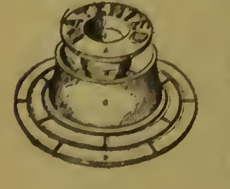
Western Gas Generators
The most reliable and cheapest GASOLINE GAS GENERATOR ever put on the market.
For Lighting, Cooking and Heating.
This Generator is used by the largest hatcheries in California for Incubating and Brooding.
AUTOMATIC, SAFE, ECONOMICAL.
Read what Mr. A. W. Foster, President of the California Northwestern Railway, has to say about them:
Gentlemen: Replying to yours of the 20th inst., I would state that the plant installed for me by the Western Gas and Power Company on my Hopland Stock Farm, is giving entire satisfaction, and I cannot speak too highly of it. Yours truly,
A. W. FOSTER.
Mr. Foster used an acetylene gas generator before we installed our Western. Send for our latest Booklet.
Good reliable Agents wanted.
Western Gas & Power Co.
1842-48 Seventh St., Oakland, Cal.

We Need Good Light
We will all agree to that. We owe it to our eyes and to those of our family.
Acetylene Gas is the best. Ask the Scientific American. Cheaper than coal oil, candle power for candle power. WE WANT YOU TO KNOW our 1908 Model as we and hundreds of others know it. And for that reason we will ship one or place it in your home on 30 days' free trial and trust you to give it a square deal. Ship it back at the end of that time or make settlement.
IS THIS FAIR? Machines in four sizes—20, 35, 50 and 100 lbs. capacity.
If you can sell a few machines in your locality we will tell you something else that will look good, when we hear from you.
Write today. Yours for a square deal,
20th Century Light Company
738 San Pedro St. Los Angeles, California



The Star Oil-Gas Burner
The Star only Oil-Gas Burner is a simple, safe and economical device for taking the place of wood and coal in all cook stoves, ranges, heaters or furnaces, without more soot or smoke than from a wood fire. The only Oil-Gas Burner that will not clog.
NO WORK WORRY DIRT DANGER

THE ORANGE GROWERS' AWAKENING.

Put away the sack and clippers,
  Put away the ladders, too;
For the golden fruit is gathered
  And there's nothing else to do,
But to just sit down and figure
  All the blossom-scented day,
How he's going to spend his wadlet
  Ere the summer flits away.

Plans a trip to "Old Virginny"
  And the home of long ago;
Float adown the broad Potomac—
  See the President, you know—
Buy a fine four-shot Pope-Toledo,
  He has dreamed of o'er and o'er,
And a furnished flat at Venice,
  All of these—and then some more.

Summer gone; oh rude awakening!
Comes a note, "you' overdrawn
At the orange growers' stand-by,"
  All his hoarded wealth is gone,
And he chuckles—softly chuckles—
  And he ponders deep and long,
"Why of course I couldn't spend it;
  And of course the bank is wrong."

And he ransacks all the drawers,
  Piling things upon the floor,
And unearths a lot of check-books,
  (Just the stubs and nothing more;)
"I have bought no bonds," he mutters,
  "Neither mines nor furnished flats;"
Then a great light fell upon him,
  He had bought two Easter hats.
—Charles L. Frazer, in Redlands Citrograph.

GOING TO JOHN.

"GOING north, madam?"

"No, ma'am."

"Going south, then?"

"I don't know, ma'am. I never was on the cars. I'm waiting for the train to go to John."

"John?"

"Oh! John's my son. He's out in Kansas."

"I'm going to Kansas myself. You intend to visit?"

"No, ma'am."

She said it with a sigh so heart-burdened the stranger was touched.

"John sick?"

"No."

The evasive tone, the look of pain in the furrowed face, were noticed by the lady who asked the questions as the gray head bowed upon the toil-marked hand. She wanted to hear the story, and to help her.

"Excuse me—John in trouble?"

"No, no—I'm in trouble. Trouble my old heart never thought to see."

"The train does not come for some time. Here, rest your head upon my cloak."

"You are kind. If my own were so I shouldn't be in trouble."

"What is your trouble? Maybe I can help you."

"It's hard to tell it to strangers, but my heart is too full to keep it back. When I was left a widow with three children I thought it was more than I could bear; but it wasn't bad as this—"

The stranger waited till she recovered her voice to go on.

"I had only the cottage and my hands. I toiled early and late all the years till John could help me. Then we kept the girls at school—John and me. They were married not long ago. Married rich, too, as the world goes. John sold the cottage, sent me to the city to live with them and he went West to begin for himself. He said he had provided for the girls, and they would provide for me now."

Her voice choked with emotion. The stranger waited in silence.

"I went to them in the city. I went to Mary's first. She lived in a great house with servants to wait on her; a house many times larger than th tle cottage—but I soon found t wasn't room enough for me—"

The tears stood in the lines of cheeks. The ticket agent came softly, stirred the fire and went After a pause she continued:

"I went to Martha's—went wi pain in my heart I never felt be I was willing to do anything so a to be a burden. But that wasn't found they were ashamed of my old body and my withered f ashamed of my rough, wrinkled —made so toiling for them—"

The tears came thick and fast The stranger's hand rested care on the gray head.

"At last they told me I must l a boarding house, and they'd kee there. I couldn't say anything heart was too full of pain. I wr John what they were going to wrote right back a long kind let me to come right to him. I sh ways have a home while he roof, he said. To come righ and stay as long as I lived. Th mother should never go out to ers. So I'm going to John. He only his rough hands and his warm heart—but there's room f old mother—God bless—him—"

The stranger brushed a tear her cheek and waited the con

"Some day when I am gone I'll never trouble them again, and Martha will think of it all day when the hands that toi them are folded and still; wh eyes that watched over them t many a weary night are clo ever; when the little old bod with the burdens it bore for th put away where it never can them—"

The agent drew his hand qu fore his eyes, and went out look for the train. The s fingers stroked the gray lock the tears of sorrow and of sy fell together. The weary h unburdened. Soothed by a t sympathy the troubled soul yi the longing for rest, and asleep. The agent went n about his duties that he mi wake her. As the fair watched she saw a smile on th worn face. The lips move bent down to hear.

"I'm doing it for Mary and They'll take care of me som

She was dreaming of the the little cottage—of the fo which inspired her long b learned, with a broken hea some day she would, homele world, go to John.—Our Du mals.

THE DIET OF CHILDREN.

Between the fifth and the tenth year of a child's life the dinner should be in the middle of the day and the supper at night, says a writer in Colorado Agricultural College News notes. Frequent eating between meals should be discouraged, although a glass of milk is usally good for the child and plenty of water should be taken during the day. Nothing can take the place of milk. It is nearly a perfect food, and the majority of children can take and digest it. A child should never take a glass of milk and drink it hastily. It should be sipped slowly or it will form a large lump in the stomach. Care should be taken to have the milk fresh and clean. It is not advisable to give milk and sour fruits at the same time.

A child may take from three to four glasses of milk a day with perfect safety.

Cream is good, but should not be very heavy. Sometimes children have very rich cream poured on their cereal and it is often the cause of bad breath and a coated tongue.

A mixed diet is good for most children.

Eggs are also a valuable food, but should never be fried. The white of the egg is very digestible. Many people think that eggs cause biliousness; but this is not the case, if the eggs are cooked carefully. They should not be boiled, but should be put into boiling water and placed in a covered vessel which stands on the kitchen table.

Cereals are particularly good, but hey must be properly cooked. In ooking prepared cereals, such as atmeal and wheat, they should be ooked three or four times longer han the time given on the box. If he cereal is properly cooked, it is suall well digested. Rice, oatmeal or any of these preparations, order to be well digested, should cooked at least three hours and a alf. Corn starch used as a soup made into pudding should be oked at least thirty minutes. Do ot put too much sugar on cereals. ne-half a teaspoonful to a saucerful what the leading physicians pre-ribe.

Fruits are very important and par-ularly useful for their effect upon e bowels.

Be careful about giving fruit to ildren. Fruit should not be under-e nor overripe. In hot weather ke great care to select fruits that e in good condition. Do not give e children too much fruit. Fruit ice is good for breatkfast. Cooked uits, such as baked apples and unes are desirable. Orange juice excellent.

Do not give tea or coffee to any ld under ten years of age. It is better not to give it until they much older. Cocoa is a good nk.

While the child is young it should rn to eat in the right way. That to eat the right kind of food at ular hours, to eat slowly, and to w the food thoroughly. Many dren half chew their food. If a d learns bad habits in eating le young, it often takes years to come them.

care of disease the amount of should be greatly reduced, and re there is fever no solid food ld be given. The same rule is in hot weather; give less solid and plenty of water.

Children should not touch sausage, salted meat, or pork, until they are ten years of age. Meats, such as a mutton chop, white meat of a chicken or beef steak is good once a day. Fried meat should never be given to children.

Bread should be thoroughly dried in the oven until it is crisp. Cildren do not always like this, but soon become accustomed to it. Mutton and chicken broth with rice, soups made of peas or spinach put through a sieve are good for children over eight years old. The baked potato is very easily digested and may be given to small children.

Stewed celery and spinach are two of the best vegetables for children. They should be thorouhgly cooked and mashed or put through a sieve. Children between three or four years of age may begin to eat vegetables if the vegetables are properly cooked. Cabbage and corn should never be given to a young child.

As for desserts, a small amount of ice cream, simple puddings or custards or baked fruits.

In preparing a school luncheon, have variety. Always have sandwiches and have them made of different kinds of bread. One day white, the next whole wheat, the next brown, and perhaps a little baking powder biscuit the last day in the week. There are so many good nourishing sandwich fillings. And mothers can very easily find a number of these delicious sandwiches in some of the cook books.

Nuts often take the place of meat, but should be chopped fine and divided. If cheese is used, it should be grated and put between bread and butter. Chopped dates or figs with a little cream mixed and put between whole wheat bread, makes a very nutritious sandwich, or nuts and raisins may be chopped together. Prunes and peanuts make a good sandwich, but they must be chopped finely and put between white bread.

Fruit should be in every lunch basket. A baked apple, a banana or an orange, may be peeled and halved and wrapped in a piece of wax paper. Two or three marshmallows or a small piece of pure sweet chocolate is allowable in the lunch basket.

In putting up a school luncheon do not forget to have some Japanese napkins. They cost only ten cents a hundred. Have an extra one that the child may use as a small tablecloth to cover the desk and an extra one for the lap.

A small bottle of grape juice makes a great addition to the lunch basket.

The Northwestern Pacific Railroad, the picturesque route of California, traversing Marin, Sonoma, Mendocino, Lake and Humboldt counties, has ready for distribution, "Vacation, 1908," giving full information in regard to camping spots, mineral springs, resorts and country homes and farms to suit every purse and taste. This book can be obtained by applying at Southern Pacific and Santa Fe ticket offices, Los Angeles, Cal.

NOT QUALIFIED TO DECIDE.

"Mrs. Cissie said she thought it must be very pleasant to be married to a clever man!"

"And what did you say, wifie?"

"I told her that of course I didn't know—I had only been married once!"

Ferndale is holding a farmers' institute this week.

America's Most Famous Summer Resort
Never Hot Never Cold Always Delightful

Coronado Tent City

Open Now

Reduced Rates Until June 10th

Coronado Tent City is literally a city of tents and Palm tent houses, large and small, furnished or unfurnished, with kitchen tent in rear if desired, accommodating one to eight people. Tents grouped about a common court for social or fraternal societies.

300 New Palm Tent Houses

Nothing like them anywhere. Delightful to live in. Free electric lights. Free ice water. Pure mountain water piped direct to your tent. Perfect sanitary conditions.

New 700 Ft. Pleasure Pier. Fine Fishing.

The famous Coronado Band. Better than ever. The old favorites and some new ones. Fine large bathing pool for children. First Class Cafe, Lunch Counter and Delicatessen. Fresh fruits, vegetables and milk. Prices very reasonable.

Literature sent free tells all about the place—how to get there—what it costs. Helpful suggestions. Write at once. Address

NOT MERE VANITY.

The rich man was building a $100,000 mausoleum, in which he expected his bones to be placed.

"It may look foolish," he admitted, "but I got the safety deposit habit during the panic."

Joseph Chamberlain was the guest of honor at a great municipal dinner. It was time for the toasts; the Mayor leaned to the distinguished guest and whispered:

"Shall we deliver our speeches now, or let the people enjoy themselves a little while longer?"

San Francisco Markets

SAN FRANCISCO, June 2, 1908.

Hay.

Somers & Co. say:

The weakening in prices during past week has had the effect of creasing shipments of hay to mark total arrivals amounting to 3150 in comparison with 3410 last we Last year it was a matter of transp tation for although stocks were n too plentiful in the country, yet e one was rushing his holdings to ket to take advantage of the h prices that were ranging at from to $3 per ton above our present m ket. This year cars are plentiful stocks much heavier than last sea but trade is much lighter and the eral outlook weaker.

The recent cool weather has h tendency to delay shipments of hay for in many districts the crop not yet ripened and is, therefore, increasing in quantity.

Very litle new hay has been mar ed as yet, the few cars that hav rived being new Volunteer of good grade. It will probably b month from now before cons will take to new crop hay at all r ily and meanwhile we have more an ample supply of old hay to sa the rather moderate demand her

We can see nothing at the m to change the ideas which we held for some little time past, the hay crop will be ample for needs and that prices will decline moderate range several dolla ton below the present quota which we give today as follows:

Choice wheat hay	16.00
Good wheat hay	13.50
Other grades same	11.50
Wheat and oat	12.0
Tame oat	11.50
Wild oat	10.00
Stock hay	8.00 to
Alfalfa	9.00@
Straw, per bale	

Grain.

Wheat No 1	1.62
Barley No 1	1.37½
Corn small yellow	1.75@
Oats white	1.
Oats gray	1.52½

Feed Stuff.

Bran per ton	32.00
Feed cornmeal per ton	39.00
Cracked corn per ton	40.0
Rolled barley per ton	31.0
Oil cake meal per ton	38.0
Cocoanut cakes per ton	28.0
Middlings	34.0

Citrus Market

LOS ANGELES, June 3,

The situation in the citrus fru ket is most satisfactory. Va are going forward satisfactorily increased price has lowered co tion to a certain extent, but w les than 5000 cars yet to go thought that all the remainde command most good Navels are practically all on th ket; sweets, seedlings and largely cleaned up so that V will soon command the field.

Lemons are advancing, owing weather of the East. Foreign still coming in quantity, but are ing poor keepers.

NEW YORK, June 1.—Eight four mixed, five seeds, two one lemon, one sweet. Market on good quality stock Weather cloudy and muddy

COULSON'S

CRESOLENE

Lice Killer
Disinfectant
and Dip

Dilute With Water Before Using

CRESOLENE is a powerful disinfectant, insecticide and germicide obtained from coal tar. It is non-poisonous, and non-corrosive and will do no harm to the most delicate skin.

It mixes readily with water, forming a milky emulsion, and can, therefore, be diluted from 50 to 100 times its own bulk, in accordance with the different uses to which it is put.

Thus when you purchase 1 gallon of CRESOLENE you can make up to 100 gallons of the best disinfectant at a cost of only 11-4 cents per gallon. Write us for particulars and guarantee.

PRICES: Quart can 50c; One-half gal. 85c; Gallon $1.25.

Freight Paid on Orders of One Gallon or More

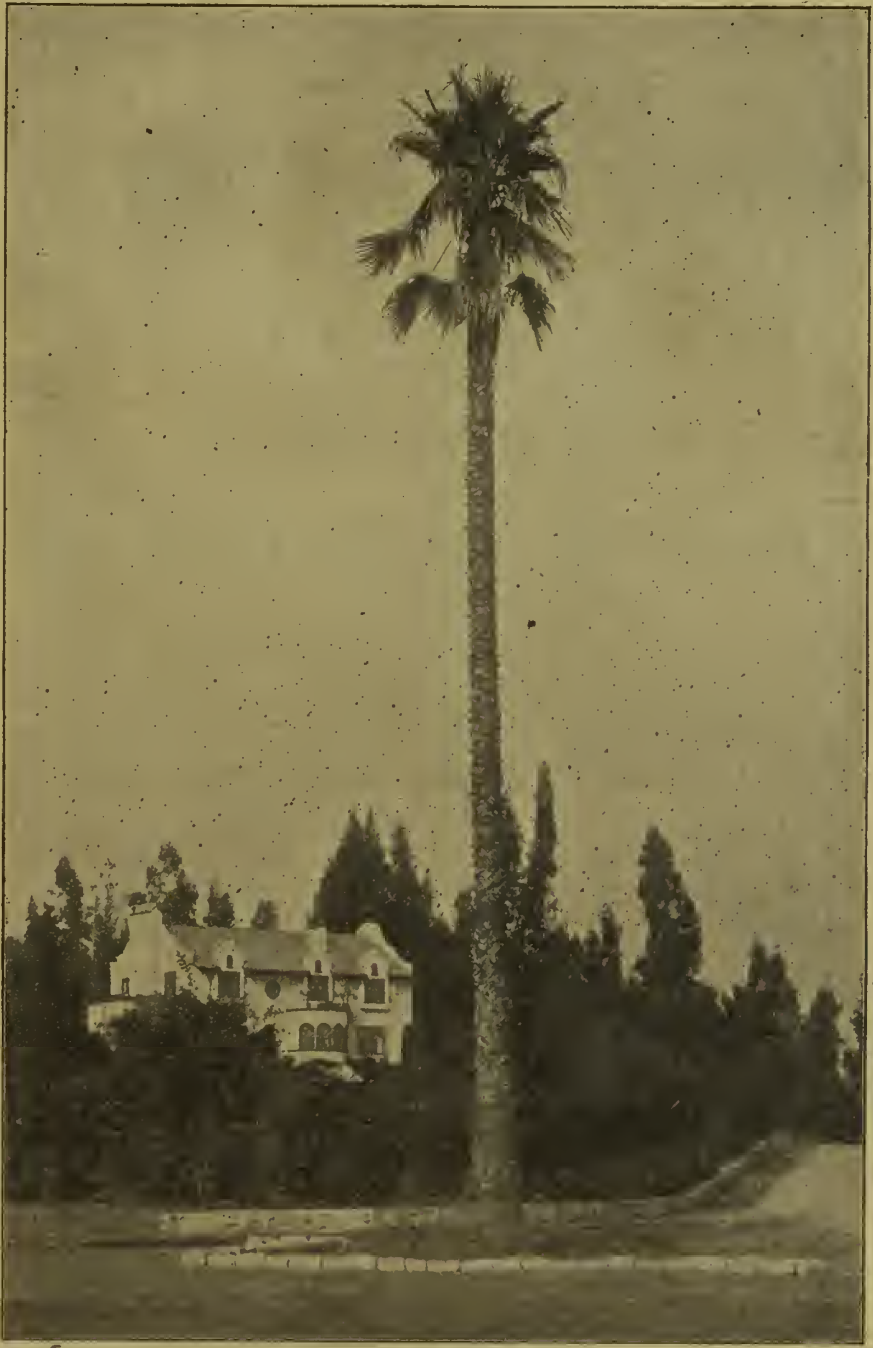
A Stately Palm at Riverside



Some years ago when the famous Victoria avenue of Riverside was laid out, a fitting mark to place at its entrance was the magnificent palm above pictured. It was moved to its present location when almost as large as it is now and it has thrived wonderfully. It is a noble palm and graces a noble avenue. Regarding the avenue, E. T. Mauzy in the Riverside Press, recently wrote the accompanying poem.

Bathed in California's golden light,
There lies, indeed, a sweet and heav'nly sight.
Along superb Victoria's beauteous way,
Where the charmed soul would fain forever stay
And be a guest at Beauty's royal feast,
Safe from the fierce storms of unfavored East.
Here where undying summer reigns supreme,
Where luscious fruits spring forth, gay flowers gleam,
They give to placid air a perfume sweet,
And fold in dreamy clasp Life's mortal seat.
Oh wondrous thoroughfare, like Cashmere's Vale,
Enchanting scenes of mountain, hill and dale,
This winding street, this tree-lined avenue,
Where every turn reveals a rapturous view,
Where myriad trees with quivering foliage green,
Like a vast sea, fairer than eye hath seen;
Where golden oranges, nectar filled, hang low,
Neighbored by ripening lemon's yellow glow,
And drooping peppers, fragrant camphor trees,
Tall, stately palms that bend in spicy breeze,
Ah! this is great earth's fairest garden spot!
And blest be they who here find life's sweet lot,
Where royal sun gives forth health-giving glow,
And soft, sweet, soothing zephyrs ever blow.
From far-off climes, a yearly pilgrimage,
A host, comes trooping to this heritage,
To spend sweet hours where snow cap'd mountains
rise,
Renew their youth in this fair Paradise.
Go search the boundless world's most favored place,
That man hath seen, or doth in legend trace,
Where nature hath, with ease, great beauty formed,
Or man with thought and skillful hand adorned,
All, all, is in Victoria's glory dimmed.
Like the pale, far off stars by dark skies rimmed
Which fade in the matchless radiance of the sun.

Conservation of Our Natural Resources

Two Fairy Stories Written by Gifford Pinchot, Forestor of U. S. Department of Agriculture

HE conservation of our natural resources is a subject which has received little attention in the past; but the facts in the case are so mple, the principles so elementary, and our duty ear that they might be fitly presented in a ike one of the old fairy tales that we all d when we were boys and girls. Such a ory would run like this:

Story With a Moral.

Once upon a time there was a young man who ad been given a great property in a distant re- n and who left home to take possession of it. hen he reached his property he first made him- acquainted with it. As he explored it and d its value he began to think how he ould make his living out of it. The problem not a hard one. He found that his property wonderfully rich, and supplied his needs at e cost of far less exertion than he would have d to make at home, for it was a fair land, well atered, well timbered, abounding in game and with broad meadows for cattle and horses eep, and with no small store of rare and minerals and an outcrop of excellent coal. was easy, and he lived lavishly and joyously, the initial hard work of moving in and ng his house and raising his first crops was He had far more land than he could use, ore game, and what he lacked he was able y from home with furs, with timber, with als and with the surplus of his crops.

ey Married.

By and by he saw and liked a girl and finally arried her. Together they prospered on the operty, which seemed too rich to make it necessary for them to trouble about the future. ere was still plenty, though less so than at t; the timber, though growing less, was still dant enough to last longer than they could pe to live, by breaking new land they could ays count on marvelous crops; the coal was little harder to get at, but still close to the face and besides the man only dug out the t to reach, and when the earth began to in he merely started again at a new place. stock grazing on the meadows, had trampled out some of the grass, but there was still no k. That some day strangers would possess r property when they had done with it, and ld find it somewhat run down, did not trouble these two good people at all.

ir children came to them with the years, and and by these children began to grow up. n the point of view of the man and his wife anged. They wanted to see their sons and ughters provided for and settled on this property of theirs, and they began to see that what as enough and to spare for them would not pport all their children in the same comfort less they themselves used it with better foresight. Through thinking of their children they re led to live more in the future.

osperity Came.

They looked forward and said to themselves: "Not only must we meet our own needs from s property, but we must see to it that our children come in for their fair share of it; so that er a while the happiness we have had here ay be carried to them." So the family established itself. The man became respected, and s children grew up healthy and happy around m; and when in the fullness of time he passed away and his children took the place in which he had stood, because of his foresight and care they enjoyed the same kind of prosperity he had enjoyed.

It is a perfectly simple story; we all of us can name scores of men who have done this same thing. The men and the women who do it are not famous, are not regarded as remarkable in any way; they are simply good, everyday, average citizens, who are carrying out the duties of the average citizen.

What We Have Done With Our National Resources.

Once upon a time there was a young nation which left its home and moved on to a new continent. As soon as the people who formed the first settlements began to examine the value and condition of this new continent, they found it marvelously rich in every possible resource. The forests were so vast that, in the early days, they were not a blessing, but a hindrance. The soil was so rich and there was so much of it that they were able at first only to cultivate the edges of their great property. It was quite plain to these people in the early times that, however much land they might cover, however much they might waste, there was always going to be plenty left. As time went on they discovered greater and greater resources. They found wonderfully rich deposits of metallic ore; great oil and gas fields and vast stretches of the richest bituminous and anthracite coal lands; noble rivers flowing through broad expanses of meadow; rich alluvial prairies; great plains covered with countless herds of buffalo and antelope; mountains filled with minerals; and everywhere opportunities richer than any nation had ever found elsewhere before.

Always A Plenty.

They entered into this vast possession and began to use it. They did not need to think much about how they used their coal or oil or timber or water—they would last—and they began to encroach on the supply with freedom and in confidence that there would always be plenty. The only word with which they described what they had, when they talked about it, was the word "inexhaustible."

Let us see for a moment what the course of development of this young nation was. First of all they needed men and women to settle on the land and bring up children and have a stake in the country. That was absolutely necessary before they could develop the great nation which some of them saw ahead. As the population spread there arose a need that great systems of transportation should be built to knit the country together and provide for the interchange of its products. These railroads called for iron, coal and timber in great quantities. Then began an unprecendented demand upon the forests. They could not build these transcontinental railroad lines without millions upon millions of railroad ties cut from the forests of the country; and they could not mine the iron and coal except as the forests gave them the means of timbering their mines, transporting the ore, and disposing of the finished product. The whole civilization which they built up was conditioned on iron, coal and timber. As they developed their continent, richer than any other from the East coast to the West, new resources became revealed to them, new interests took possession of them, and they used the old resources in new ways.

In the East, the rivers meant to them only means of transportation; in the West they began to see that the rivers meant first of all crops; that they must put the rivers on the land by irrigation before they could grow wheat, alfalfa, fruits, sugar beets and other crops that make the West rich. They found that to feed the vast population which had grown up in the East they must have the vast ranges of the West to grow meat. They found that the resources of soil and water which produced the wheat, the cotton and the meat—of iron and coal, and of timber, together made up the working capital of a great nation, and that the nation could not grow unless it had all of these things. In taking possession of them our nation used them with greater effectiveness, greater energy and enterprise, than any other nation had ever shown before. Nothing like our growth, nothing like our wealth, nothing like the average happiness of our people can be found elsewhere; and the fundamental reason for this is, on the one side, the vast natural resources which we had at hand, and on the other side the character, ability and power of our people.

Now what have we done with these resources which have made us great, and what is the present condition in which this marvelously vigorous nation of ours finds iself? The keynote of our times is "development." Every man from New York to San Francisco looks to the development of the natural resources to produce the advantages and the opportunities he wants for his neighbors and his friends. Anyone who questions the wisdom of any of the methods we are using in bringing that development to pass, because he believes we are making mistakes that will be expensive later on, is in danger of being considered an enemy to prosperity. He is in danger of having it thought of him that he does not take pride in our great achievements, that he is not a very good American. But in reality it is no sign that a man lacks pride in the United States and the wonderful things our people have done in developing this great country because he wants to see that development go on indefinitely. On the contrary, real patriotism and pride in our country make it the first of all duties to see that our nation shall continue to prosper. In sober truth, we have brought ourselves into a condition in which the very serious diminution of some of our most necessary resources is upon us.

The Problem Before Us.

This nation has, on the continent of North America, three and a half million square miles. What shall we do with it? How can we make ourselves and our children happiest, most vigorous and efficient, and our civilization the highest and most influential, as we use that splendid heritage? Ought not the nation to undertake to answer that question in the spirit of wisdom, prudence and foresight? There is reason to think we are on the verge of doing this very thing. We are on the verge of saying to ourselves: "Let us do the best we can with our natural resources; let us find out what we have, how they can best be used, how they can best be conserved. Above all, let us have clearly in mind the great and fundamental fact that this nation will not end in the year 1950, or a hun-

With the Citrus Growers

SETTING OF ORANGES.

WE cannot tell the experienced grower about the sensations experienced when all the oranges seem to be dropping off of the trees. Those who have been growing this fruit for a few years know that it is not desirable for more than four or five out of every 100 blooms to mature. If they did, the trees would break down even if propped. But with the novice it is quite different. He imagines that all the oranges are gone for sure. However, the last two or three years has seen a dropping in many localities that makes the veteran grower feel creepy and nervous with apprehension. Some of the finest appearing groves have fallen off in production during the last few years. The prop was at one time a necessary adjunct to most groves, but now in recent years they are the exception. Just why this is true is not easily explained, though there are certain examples which might give a clue to some of the elements that enter into the case.

It is difficult to judge what the crop will be till the oranges are at least half grown. Up to this time they are so small that they are largely covered by the leaves, and being of the same shade of green, are difficult to see. No buyer will venture to purchase a crop until the fruit turns yellow so that the amount may be seen. The fruit inside of the trees counts for more than is often appreciated. Very often a grove that shows up an apparently large crop from a distance will not have as much fruit as one that appears to have no more, because it has a larger amount of inside fruit.

Some writers claim that the Washington navel is a weaker orange than one that bears seeds, and this accounts for the heavy dropping of the bloom. This is not a fact, because the Mediterranean sweet is not seedless, and it is one of the heaviest bloomers and also drops as badly and often more than the navel orange. Some advance the theory that cutting the roots during plowing or cultivation at certain times causes the dropping. This will not always hold good, as we have often seen the contrary, though it may contribute to the cause under certain conditions which we do not know about.

It was at one time thought necessary by deciduous fruit growers to do a certain amount of root pruning in order to make the trees grow.

Climatic conditions cannot have everything to do with it, as often adjoining groves will continue to maintain a wide difference in production. It is in all probability due to the treatment of the trees either in cultivation, irrigation or fertilization and, perhaps, when the proper combination of these is worked out, there will be more abundant crops. It is quite noticeable that those groves, as a whole, whose cultivation has allowed the feeding roots to continue as close to the surface as is compatible with proper maintenance of moisture during the summer, have been the heaviest producers, yet there are some striking exceptions to these results. That climatic conditions have not all to do with dropping is quite evident from these facts. One striking case came to our notice a few years ago when Riverside was visited by a long, hard hail storm early in April. It was so severe that some trees had their tender leaves torn, but the young fruit that was just out of the bloom came through all right and a good crop matured.—J. W. Mills.

OVERPRODUCTION.

C. M. Brown of Redlands writing to an eastern paper in reply to a statement that California will soon be producing eighty or ninety thousand cars of crops a year, says:

Your correspondent tells you that there are over eight million bearing orange trees and one and one-third million non-bearing trees, or fully seven bearing orange trees to one non-bearing, and if we now are producing in all 20,000 to 25,000 cars from eight million trees, how are we to produce 88,000 cars from nine and one-third million orange trees when it is a well known fact that a great majority of the orange trees now bearing have been producing for the past two or three years a considerable quantity.

Orange planting came to almost a standstill during the days of the late lamented Agency. Furthermore, your correspondent does not tell you of the thousands of trees that are going out of bearing each year from various causes. Many sections that were planted to orange trees were planted in places not suited to the business, and they did not thrive; the trees are neglected and rapidly going out of bearing. Other sections have found it more profitable to grow alfalfa. Famous old Magnolia avenue is a fair representation, once the pride of every true Californian, and one of the finest orange groves in the world, it is now almost an entire alfalfa field. The tremendous heavy amount of irrigation above this section forced the water almost to the top of the ground along that avenue, and their orchards died out.

In our own town, our little city was started in the heart of the orange orchards and our town has grown so wonderfully that acres and acres of our finest orchards have been cut out for building sites and as a matter of fact in the last four years we have not increased our orange shipments, and while we are continuing to plant we are at the same time cutting out so many of the old trees for building purposes (and this is not the only town that is growing) we do not show the increase that would be expected.

It is always interesting to note how some theorist or some "well posted railroad man" can give you all the information about the output of the California orange crop, and while we sincerely hope it will grow in quantity, there is no prospect whatever of California being able to supply the demand; the demand is growing faster than the production and there is no product from any source whatsoever that has stood the brunt of the recent financial panic like the California orange.

You will understand that this communication is not intended to be a criticism, but what we believe to be facts relative to the situation in California, and is for your own personal information.

Only they are masters among men, and acceptable followers of the great Master, who have first mastered themselves.—Ellis.

California Horticulturally

DAMAGE FORM THRIPS.

AS the season advances it is evident that the prune crop of the Santa Clara valley will fail very h below normal. This shortage ue to the destructive work of the ips, an exceedingly minute insect, mall as to be barely visible to the ed eye, yet which has, nevertheless, wrought hundreds of thousands lollars, worth of damage to the growers of one of the chief fruit ions of the State. This pest ats the vital organs of the fruit e it is in blossom and either des those parts or so damages them the resulting fruit is deformed, rfed and worthless. It also ats the fruit when it is first forming he blossom, and while fruit so ated may remain on the tree, and aps ripen, it will be scarred and rmed and unmarketable. So far ective remedy has been found st them. The best means of ing them so far, has been found e along the lines of prevention. insects winter in the ground, a t depth beneath the surface, when are developed and the spring e the sap up the trees they leave ground in countless millions and e their way up the trees to the soms. If the surface of the soil is ed under before they migrate to trees most of them will be buried nd escape and so some protection ded to the trees.

HE NEW STATE INSECTARY.

rk on the new State Insectary at amento is being pushed ahead ily, and within another month it be finished and in operation. The of propagating beneficial insects then be carried on as never be- as the Commission of Horticul- has never had proper facilities his work, and what has been done been accomplished under the most re conditions. The new insect- will be fitted up in the most aped manner for the work in hand, one of the finest and most com- insectaries in the United States. Jeffrey is not a fanatical believer rasites as a panacea for all vege- ailments, but it is evident, from work that he is carrying on that ves them credit for all they are , and that, in spite of rumors ted before his appointment, he t intend to abandon them and pel everybody to fumigate. He is inly preparing for work with ficial insects as it has never been ed on before, and we may look ood results from his efforts.

ER TREE PESTS THIS SEASON.

ct pests of the orchardist and r have not appeared in as de- tive numbers as usual this sea- Aphids have shown up to some t, but their ravages have not as bad as usual. Grasshoppers, antity, have not yet been report- d very many other of our com- insect pests do not appear to be ld as they usually are. It is full for the cutworm visitation, but y these pests begin to be notice- about this time. Fungus dis- too, are not nearly so bad this The peach blight, which has very bad and apparently spread- r the past three years, is doing damage this season, while peach eaf is not common. This is due probably, to climatic conditions. Fungus diseases are worst during warm,. moist weather, such as we usually have in the spring. This spring we have had light rainfalls and dessicating north winds, which have dried up the fungus spores and prevented their germination.

FRUIT PROSPECTS GOOD.

The present season is an extraordinary one for fruit, and with all classes there is an exceptionally heavy crop. In spite of the damage done by the blight, the Sacramento valley will have a very good crop of pears, the largest for several years past. Apricots and peaches are now so far advanced that there is no question as to their yield, which will be the heaviest in years. Active work in thinning is now in progress in the orchards, and the fruit has set so thickly that this operation will be an expensive one this season. In the berry sections the same report is made, the vines are bearing as rarely before. The exception to this is the report from the Santa Clara valley where the thrips have done such destructive work in the prune blossoms, that this crop will be very greatly reduced, and in some sections will be almost a failure.

THE CAMELLIA CITY.

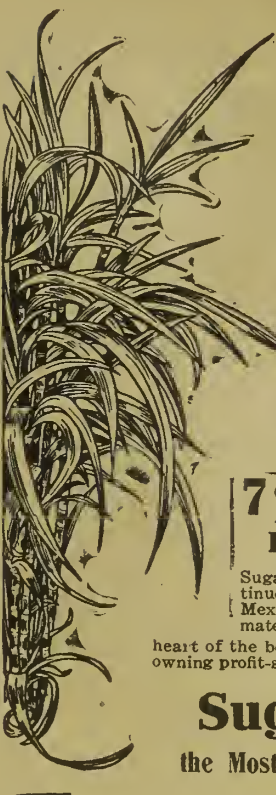
Sacramento, not to be behind her sister California towns, has adopted a fancy or a pet name, and will hereafter be known as the Camellia City, as Santa Rosa is known as the City of Roses, San Jose, the Garden City, Los Angeles, the City of Angels, etc. Certain it is, that the camellia grows in Sacramento as nowhere else in California, if on earth. These plants grow here to be large trees and in the winter are covered with large, waxy, showy blooms of all colors. From Christmas until March, these flowers are the admiration of all visitors and have done so much to give Sacramento her reputation that she does well to adopt the camellia as her civic flower and christen herself the "Camellia City."

FLAX IN THE SACRAMENTO VALLEY.

California has not paid much attention to flax growing in the past, although enough has been produced here to show that it will do well when given proper care. Hemp has been grown on a commercial scale in Butte county and the fiber sent East to market. Of late years, however, little has been done in this line, and the fiber industry has declined to a low ebb. An effort is now being made to get the farmers of Butte county interested in flax, and a San Francisco firm has offered to contract for the product of 5000 acres if it can be secured. The Gridley Chamber of Commerce has taken the matter up and will endeavor to get the industry started in its vicinity.

A HINT FOR BERRY GROWERS.

Berry bushes are now making their rankest growth, and this is the time to prepare them for another season's crop. The wood which is produced this year bears the fruit for next. Therefore, the more of this new wood we get the better the chances for a good crop another season. Now, if the bushes are left to themselves they will throw out long canes, often many feet in length, long, straggling and in the way. By nipping back the tender growth when it has gone far enough, laterals are forced out and the cane becomes a bush, having a large head of new wood for fruiting another season. Go over the berry patches and pinch back all rank growing canes.



A Life Income From Land

We offer you Cane Sugar Lands in Mexico. Perfect title. Give 50-year contract to cultivate for you, guaranteeing 7%, paid semi-annually, until crop profit exceeds this amount. Offer these lands for cash or on easy terms.

7% Assured Profit

Sulphured Fruit and the Pur Food Law

By ARTHUR R. BRIGGS

Continued from last week.

The fruit industry was by this amendment still left in a position of uncertainty and in a demoralized condition. Growers held meetings, made appeals to the Department through tne delegation in Congress, and finally to President Roosevelt. Acting with his accustomed promptness the president took steps to create what was denominated a "Referee Board" to which matters connected with the dried fruit industry, theretofore, left with the "Bureau of Chemistry and the Agricultural Department" for determination, were to be submitted.

The Referee Board was constituted by appointment of five eminently scientific men of extensive experience in chemistry and pathology Its personnel is: Dr. Ira Remsen, chairman, president Johns Hopkins University, Baltimore. Prof. Russell H. Chittenden, Yale University, New Haven; Prof. John H. Long, Northwestern University, Chicago; Prof. Alonzo E. Taylor, University of California, Berkeley; Dr. C. A. Harter, Special Inspector of Foods, New York City.

The high character and standing of this Board gives confidence to those engaged in the fruit industry. It is believed the importance of the industry, as it relates to the welfare of the large number of people interested in it, as well as the deleteriousness of dried fruits cured with the use of sulphur, will be carefully and broadly considered. It is felt that the conditions under which "sulphur dioxide" renders dried fruit deleterious, if it is rendered so at all by the present method of drying and handling, will likewise be considered. The hope is entertained that the findings of the Referee Board and its determination, will furnish the Agricultural Department, independent of the Bureau of Chemistry, a basis on which to issue a new decision that will enable fruit growers and fruit dealers to pursue the occupation of drying and distributing fruit in a lawful and satisfactory way.

It is hoped also that the Referee Board in its investigations will come to California during the curing season. By having opportunity to observe climatic conditions, and by following the fruit from the tree to the packing house and until it is ready for distribution, the Board will be better able to decide what is essential to the fruit industry in this State, than if its findings and recommendation are based on purely technical examination.

Following closely on the issuance of Decision 89, at the request of the fruit growers of the State, I went to Washington to get, if possible, a modification of that decision.

As a result of the mission to Washington the following official declaration was obtained in a letter to Hon. Mr. Needham:

"In response to your personal inquiry made this date, when you called upon me in company with Messrs, Arthur R. Briggs and W. H. Brailsford, now here representing the fruit growers in the State of California, in regard to Food Inspection Decision 89, I beg to advise you that in my opinion, it will be impossible for the Referee Board of consulting Scientific experts to arrive at a determination of the question of the wholesomeness or unwholesomeness of sulphur d ide in fruits cured by the ordin sulphur process for a number months. and perhaps for a lor time than that. In any event, and the fruit growers of Califoi may rest assured that no decision verse to the use of sulphur wil promulgated so as to affect the cu or marketing of the 1908 crop.

"The curing and marketing of 1908 crop should be done under terms of Food Inspection Decision and if the terms of that Decision complied with, there will be no ernmental interference with the ing or the marketing of said crop [Signed] James Wilson, secreta

This was the status of the m until April 24th when Congr Needham telegraphed to the S Board of Trade, as follows:

"Sulphur question will not be ta up till one year from next Aug Dr. Taylor has gone to Europe this was agreed upon before he Growers will have two years before any finding is made."

Postponement of a consideratio this matter by the Referee Boa told in Congressman Needham's gram, affords opportunity for a paign of education in respect to fruit interests that may very pr ly be taken advantage of. Fruit ing in California is done under ditions unlike those in other S The fruit is generally larger juicier than that grown elsewhe ripens fast after coming to m and must be handled quickly size of the fruit and its rich juice render it necessary, whe placed on the trays to dry, tha means of arresting oxydizat used. Sulphur, which arrests zation and prevents the fruit turning dark, also assists the p of drying, and has come to be lo on as beneficial as well as effec

What is described as the sulphu cess is probably known to every but even if this is so, it may not b of place to say, the process c in subjecting the undried fruit, freshly cut and placed on trays, to sulphur fumes formed burning raw sulphur in a house or box. The house or filled with trays loaded with fr small quantity of sulphur in a pan is placed on the floor and when the door is closed and the from the burning sulphur pa the fruit and leave the sulphur ide, which is found by chemi amination in the dried produc phur is a sterilizing agent germicide. By its use the germs, if any exist, are made mant or they are destroy fruit is also rendered less attract insects during the process of than it would be if not sulp This is the first process in su ing, and if the fruit is intel handled only a small per cent o phur dioxide remains after the is dried.

eat crop in Hamilton is looking

Direct from growers it is mainly unsuited for distribution in either domestic or foreign markets.

In the packing house, before it is put in boxes for distribution to the trade, the fruit is again sulphured. In being prepared for packing it is dipped quickly in hot water, which moistens the surface and softens the fruit, after which it is subjected to the sulphur process. This again prevents a change in color and with the hot water plunge kills any germs there may be in it. This is the process called "resulphuring," and which has led to considerable criticism, chiefly from persons not familiar with the requirements of trade. While dipping and resulphuring adds somewhat to weight, it has little, if any, merit from the point of profit to the packer. This is taken into account in making purchases from growers, so that they really derive the benefit, whatever it is.

If abuses have occasionally crept in under custom of resulphuring, this is not sufficient ground for general condemnation of the use of sulphur in curing or putting up dried fruits for market. No branch of business is entirely free from abuses, and no community is free from wrong doers. The packing of fruit is as legitimate and well conducted as any other branch of commercial business. If excessive use of sulphur has occasionally been resorted to in the dried fruit business, it does not seem necessary to apply a remedy so drastic as to imperil the entire industry. Fruit growers, and dealers generally, recognize the merit of the National Pure Food Law and are ready to uphold it. They, however, want the law wisely and justly interpreted and administered.

Abundant scientific testimony is obtainable to seemingly establish the wholesomeness of dried fruit cured in the manner usual in this State. If examinations by local chemists and pathologists is insufficient there may be added to it testimony of high authority from other States and other countries. Professor Hofman, "Honorary Medical Adviser and Director of the Hygienic Institute of the University of Leipzig," Germany, in the year 1903, in an action brought in Germany to determine whether apricots said to contain a larger percentage of sulphur dioxide than was permitted in that country, testified that "neither in the literature, nor in the practice of physicians, nor in the records of the Royal Medical College, was one single case known or reported, where sulphur dioxide consumed in dried fruits, had caused injury to health."

Against the attitude of Dr. Wiley, of the Bureau of Chemistry, and his opinion, stands the opinions of eminent chemists both in the United States and foreign countries. If there exists a doubt in respect to the effect of sulphur dioxide in fruit dried by the use of sulphur, fruit growers should be entitled to the benefit of it, until the fact is indubitably established, particularly as the custom of drying fruit by the use of sulphur has been almost universally followed in this State for many years without any known injurious results.

But laying aside the matter of opinions and preference, the National Pure Food Law it seems has clearly set forth a conditon under which examinations of dried fruit should be made. The Act of June 30th, 1906, in reference to food, says:

"That when in the preparation of food products for shipment they are preserved by an external application applied in such manner that the preservative is necessarily removed mechanically, or by maceration in water or otherwise, and directions for the removal of said preservative shall be printed on the covering or package, the provisions of this Act shall be construed as applying only when said products are ready for consumption."

It has been fully and satisfactorily demonstrated that by washing, soaking and cooking, the sulphur dioxide contained in dried fruit almost entirely disappears, at least the percentage is very greatly decreased. If ruling 76 had prescribed how tests of fruit should be made, as producers and packers claim was clearly intended, according to the language of the Act, viz.: by examination of the cooked product, "when ready for consumption" no controversy would have arisen and, no doubt, would have been entertained of the intent of the Bureau of Chemistry or of the justice of the Act.

Another feature of Decision 76 open to fair criticism is, that it fixed an arbitrary unit of sulphur dioxide as permissible, viz.: 350 milligrams per kilogram, or thirty-five one-thousandths of one per cent. prior to a determination of the unit of safety, or without attempting so far as any public utterance of the Bureau of Chemistry is concerned, to establish such safety unit. If the unit fixed is made to apply after an examination of the cooked product, it is entirely reasonable and satisfactory. If it is applicable only to the uncooked product it is manifestly too low. The unit of .035 of one per cent appears to reflect a theory rather than a determination on examination and inquiry based on a comprehensive view of conditions incident to actual use of the product as food.

I am satisfied that reference to the Referee Board of the issues involved in the sulphur question, and the action of that Board have the approval of Secretary Wilson, who has exhibited a disposition to protect the fruit industry of this State. Dr. Wiley maintains a defiant attitude. His endeavor seems now to be to demonstrate that sulphur is an unwholesome ingredient and should not be used, because its use produces sulphur dioxide, " an added substance which may render the fruit deleterious." He openly says, it is the fight of his life to maintain the position he has taken in the use of sulphur.

Aside from all scientific consideration, it may not be out of place to consider the sentimental question involved. It is no exaggeration to claim that there is in the disturbance over the use of sulphur, a serious menace to the present prosperity and future development of California, which only those who know our industrial processes intimately and accurately can appreciate. It is, therefore, important that the question now agitating fruit growers should be wisely, speedily and permanently settled. For the crop year 1908 the matter seems to be fixed with reasonable assurance of safety on the part of all concerned, but the interpretation of the National Pure Food Law in its application to California dried fruit products is of vital and very general interest.

Happy the man, and happy he alone,
He who can call today his own,
He who, secure within himself, can say—
"Tomorrow do thy worst, for I have lived
today."
—Dryden.

The Ornamental Garde

THIS MONTH.

GLADIOLI are beginning to bloom heavily now and need lots of water. The writer has a large bed which, after blooming time last year, was relieved of its largest bulbs, then the old bed covered heavily with stable manure. Those bulbs, which were left, started early and are now giving magnificent blossoms. Another bulb giving bloom now is one captured in the mountains a couple of years since. It is the Humboldt lily, of which Bailey says: "A noble, dignified, commanding plant, and one which ought to be cultivated oftener." To get this bulb a good half hour's work digging with fingers, sharp sticks and stones was necessary amongst the roots and gravel of a canyon of the Sierras to get it, but the pleasure since has well repaid. The bulb was dug up when in full bloom, so it was hardly expected to live, but it has proved hardy. Now is the time to find them in the mountains.

Chrysanthemums may yet be planted, though it's getting late. Plant cosmos and other fail annuals. Plant bamboo. The Japanese Giant is a fine one to plant, but any bamboo is attractive.

Shasta daisy plants may yet be divided, but should have been done earlier. Give the old plants, which are now blooming heavily lots of water. It takes lots of water to make big flowers.

Rake the lawn often to keep the Bermuda grass from "running" and increasing. Plant new lawn, unless you prefer to start in fall when Bermuda is not so persistent in spreading.

Hoe and cultivate plenty for that is cheaper and better than excessive irrigation.

PETUNIAS.

THE petunia is again coming into favor. Not the single-colored old-fashioned flower of our grandmother days, but a glowing giant, rich in perfume, varied in tint and remarkable for size and shading, says the Indianapolis News.

When one gets the fragrance from a petunia border, it may not be quite pleasant to remember that it receives its name from the Brazilian word "petun," which means tobacco. Petunia is a solanaceous plant native to South America, and we are at liberty to forget that its brothers and sisters are called tobacco, nightshade and red pepper We may love flowers for what they are, as there is no ancestor worship in the floral kingdom, no heroes nor heraldry.

The petunia is one of the best, hardiest and most easily grown of all border plants. It endures heat, cold, drought or wetness with equal facility, constantly producing a wealth of attractive bloom throughout the long blooming season. Many prefer the single flowering for the border or for massing; the effect is gorgeous in the extreme when the single colors are alternated and the giant blossoms, some of them six inches in diameter, go swinging in the breeze. The rich reds remind the beholder of ribbons of flame.

Although a perennial, the petunia is treated as an annual, except in the case of especially choice varieties. Plants raised from seed bloom the first year and are then cast bloom being secured from new annually. In California the plan often topped and then the blooms in favored localities month in the year.

Seed of the large double va produce about 25 per cent of blooms, but many of the ch double varieties are propagated cuttings. In the States east o Rocky Mountains it is well to so tunia seed in autumn to secure blooming, except in places wher ere frosts occur in the spring.

Petunia seeds are very small should be sowed in light soil, ir or boxes and the drainage shou good. Moisten the soil well and it firmly and evenly before sow seed. Those who plant petuna for profit, heat and sift the through fine garden sieves, to fermentation, and to secure th degree of fineness.

A very light covering of should be applied, then watere and lightly, to prevent the see washed into heaps. The pots or should then be covered with g the seeds germinate; the glass be removed gradually until the are one-fourth inch in height. may then be transferred sing pots or boxes, where they wi well until the weather is suit plant them in the open ground seeds are planted, say in Feb they may be allowed to remain seed pans until ready to tra out of doors.

The best soil for growing p in the open border is a m rich, light loam, but, as stated, the petunia will thriv good garden soil. Excessive ing will cause a rank and rap d g of the plant without a corresp result in size and number of b Give the petunias an open, su tion and an occasional wat very dry times and you will be r ed with a harvest of fragrant, blossoms.

Nearly all of the perfume u the world is exported from Italy, near Nice. The value product is about a million and a year. In the surrounding c in the valleys and along the mo sides, are 60,000 acres of flow Every spot a flower can be grow in is under cultivation a plants are carefully attended rigated. The very atmosphere place carries a eau de cologn as the factories are constantly ing the petals of the bitter blossoms from which this perf made. Many kinds of flowers season, but the orange blosso always available. Men, wo children work in the flower which is not an unpleasant tion although the pay is smal.

The tea rose is the exempli and realization of the highest of beauty in flowers. Form, fragrance are here blended so excite wonder and admirat every observer and claim love the devotee of flowers.

Small Fruits and Vegetables

CULTURE OF THE LOGANBERRY.

MR. A. P. ASPINWALL, of Brooks, Oregon, at the recent meeting of the Oregon State Horticultural Society, read a paper on the Loganberry, excerpts from which we have gleaned as follows:

The Loganberry is one of the more recent additions to the berry family, It was originated by Judge J. H. Logan near Santa Cruz, California, and is a hybrid, being the result of crosspollenizing the Aughinbaugh blackberry, a wild variety in California with the Red Antwerp raspberry.

Blackberry-Raspberry.

The Loganberry may, therefore, properly be called the blackberry-raspberry. The vine is long and trailing and the leaves coarse and dark green, resembling the raspberry. The fruit, in the form, size and structure is like the largest sized blackberry. In color it is dark red when fully ripe. Its flavor partakes of both the blackberry and raspberry, being mild vinous and delightful to the taste.

Propagation.

There are several ways of propagating the Loganberry. My practice is to bury the ends of the vines in the fall several inches under ground. During the fall and winter these tip ends strikes root, when during the warm days of spring, they can be cut from the parent vine and transplanted. I very much prefer good, strong tips to transplant a year or more old. A much larger percentage will live and the canes produced from the tips will be stronger.

The cultivation of the Loganberry naturally divides itself into two branches. First, growing them for home use, and second, for commercial purposes.

As a yielder, the Loganberry has no equal. On good soil and with proper cultivation, an acre of the vines will give an average yield of 500 crates, weighing 24 pounds each, or a total of six tons of berries. Under more favorable conditions, eight tons per acre is not an enormous crop.

Location.

Having decided the object and extent of your planting, tbe next step is to select a suitable location. A level tract is preferable to a hillside because of greater ease of cultivation and trellising and less likelihood of deep, rich, dark loam, if you have it. The plants and berries will then reach their maximum growth. A clay subsoil is preferred to one of sandy or gravelly texture because of the added moisture within reach of the roots, while the berries are maturing.

Any good soil with a fair amount of fertility, however, will grow an average crop of berries if properly handled. Good returns are secured from sandy or gravelly loams where there is enough fertility to grow grain crops profitably.

Do not make the mistake of crowding your plants. Give them plenty of room to secure the necessary air, sunlight and soil in which to spread their roots. I prefer to set the plants in rows about eight feet apart each way, making 680 plants per acre. Most of the cultivation can then be done with plow, harrow and team:

The first year the vines will not make much growth and do not interfere materially with their cultivation until about the 1st of August, after which they frequently shoot out 18 or 20 feet or even more before winter.

Trellis.

Build your trellis substantially. Use good, strong cedar posts and set them not over 32 feet apart in the berry rows. Securely fasten to these three or four No. 12 galvanized wires spacing them equal distance apart. Now train each vine separately on the wires. Distribute evenly and see that each wire carries its full share of the weight. If practicable have the trellised rows running north and south. thus the vines are much better protected from the winds and ripen more evenly, as they get both morning and afternoon sunshine.

Pruning.

As a general rule, the Loganberry needs but little pruning. Do not thin out until more than a dozen vines appear on a hill and then remove only the weaker canes. The yield will be larger and quality of fruit improved if the pruning shears are not used too freely. A fair amount of foliage on the vines for shade is an advantage.

Cultivation should be thorough and frequent, at least until harvest begins. This will add greatly to the health and vigor of the canes, and is of the first importance in the development of a full crop of large, firm berries. As the season advances, see that the harrow is set more shallow with each successive cultivation and followed each time by the clodmasher which will make a dust to hold the moisture. Have a careful trainer go ahead of cultivator to turn in all arms that dangle out from the trellis, to prevent the team from breaking them.

The harvest continues six weeks, during which time the vines should be carefully gone over every alternate day and the ripened berries gathered. Do not allow the fruit to get overripe. It will not handle so well in shipping.

PEANUTS AND POPCORN.

We would like to see more farmer boys giving a little of their time to the growing of peanuts and popcorn for home use. Peanuts do fine under irrigation if planted on a warm, sandy soil. They should be planted as soon as danger of freezing is past, or say along with the planting of melons and corn. Rows from 30 inches to 40 inches apart and drop the kernels one in a place every eight inches covering to a depth of two or three inches. When the vines begin to blossom the runners may be covered with fresh earth to hold them down in good shape so they will take root. The peanuts will set on very well without having any of the vine covered, but should be well hilled up and if slightly covered at the right time the crop will be improved. The soil should be well prepared to give the plants an early start as the guberplant requires a long season of perfect maturity. The culture of popcorn is the same as field corn or sweet corn and if grown in considerable quantity will meet with ready sale at a price which will insure a profit, besides it is a fine thing to have an abundance of these luxuries for home use.—Ranch and Range.

I have known the time when a cucumber barrel was not an uncommon piece of garden furniture. It afforded a convenient and serviceable method of utilizing a small space to an excellent advantage. A headless barrel was set in some handy place about the garden and the soil hilled up five or six inches around the bottom. The barrel was half filled with manure and eight or ten inches of soil placed on top. The cucumber seeds were planted in a circle about a foot away from the barrel. Water, preferably slops or soapsuds, were poured into the barrel occasionally, which, escaping from holes in the bottom and through the manure, was greedily taken up by the roots of the cucumber plants. The crop that can be grown in this way is surprising and I am going to try the scheme this season.—Field and Farm.

FEEDS.

THE fruit growers rarely grow the feed consumed by their stock. Barley and grain hay, they say, is cheaper to buy than it is for them to grow on high priced lands. I do not believe it is necessary to use exclusively rolled barley and wheat hay for work stock. There are many crops that will give satisfaction and can be grown on small pieces of land. The fruit grower's idea in the main is the good one of never growing anything between the trees or vines. I say the idea that the land needs all its fertility for the fruit is a good one, but often it is stretched too far. A little crop, and the land fertilized afterwards, will often by the very extra cultivation put on for the second crop not be hurt very much. It is a good deal better to overwork the land a little and let the wife have a maid in the kitchen, than to save the land and let undue economy rule in the home. I sometimes think it matters little how much we have to do without if we can keep the edge off the home life. The children should not be made to see the sordid side of life. The economy that is wise covers the bare spots with roses, and never speaks of stinting, but makes even the simplest of foods palatable by careful preparation and neat service.

Prices.

The piece of land set apart for growing fodder must be kept at work in order to produce heavy crops; it must be fertilized and watered and the crops kept growing all the time. There was a time, and that not long ago, when the vineyard and orchard merged into the fields of wheat and barley. When straw was given away to those that would haul it off. Today, barley and wheat hay are hauled long distances often by train, with heavy freight to pay. At present, owing to local conditions, the rolled barley and chicken wheat of Fresno is coming from the Bay counties. Wheat and barley are golden at $34 a ton to old cash customers, and up to $37 to the poor unwary ones that buy on time or owe the merchant for supplies.

Growing Feeds.

When two or three tons of grapes are not worth more than a ton of barley, then the vineyardist must grow the major portion of his own feed, if the ranch is to be handled with regard to expense. In planting grain hay how slovely it often is done. Better reduce the acreage if it cannot be put in properly. It does not pay to put in poor seed and plow it merely with the gang plow with seeders attached. Plow the land when the first rains fall, harrowing at once, then put on a heavy cultivator, one that will stir the land down eight or ten inches. This cultivator will require four or six animals to draw it. Then follow with the seeding. Bald barley 50 pounds; wheat 50 pounds and oats 50 pounds to the acre. First sow the wheat and barley and harrow it in well, then sow oats and brush it in lightly. Now watch the land and if the surface crusts at all after showers, run over it with the straight tooth harrow to loosen the surface. The little grain the harrow will remove is but a trifle compared to the good harrowing does on the grain field. Two or three harrowings may be required before the ground is shaded by the crop. The mixed grains make a better hay for home use, though less saleable than hay from one straight grain.

Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

Dry Farming.

Dry farming consists in sowing a crop every other year and by cultivating conserve all the moisture possible from two seasons to grow one year's crop. The greatest loss of moisture comes from not keeping the surface broken; if this is done constantly, there are few years in California that the crop cannot be produced every year. The real reason for this form of farming is that the grain man has not enough horses and does not live near enough by to handle the land as a farmer.

Adam.

Dry farming in arid countries is as old as the garden of Eden. When Adam was turned out of that well watered plain he did not have fruits, forbidden or otherwise, to eat. He grew to be a man at once and took to dry farming. It has been found that the warm arid lands were better for health than the moist humid lands. That men were better men when they farmed with brains instead of muscles for they soon made the desert to blossom like the rose.

The use of water has been abused greatly and the need of drainage has come to Fresno county. I will at some other time tell you of the wonderful success of the drainage, by tilling the land, in removing surface alkali.

Corn.

Heat and moisture make corn a staple crop. Like other grasses of the semi-tropics or perhaps the tropics, corn rejoices in the long, hot days. I have been measuring the corn this morning from the pedigreed seed. It stands three and a half feet high, while corn in the same field grown from common seed, planted and grown as nearly like it as possible, is only twenty inches high. The corn plant has a definite life period, and we can only increase its size by keeping it growing all the time. One hundred to 120 days is the time it takes from sowing to husking time.

The corn may be cut and fed green or it may be siloed. On good corn the average individual plant should carry two full ears and a nubbin. The ears may be taken from half the corn plants and yet leave a good quality of silage. This corn is then used for the work horses. It is a little more economical to have it coarse ground or cracked for feed, as the older horses may pass the whole grains undigested.

Silage.

Silage is a quantity food rather than a quality one. The cows need its succulency rather than the grain it contains. The grain may, therefore, be largely removed if it is not thought desirable for them to have any grain. Feeding it, half eared or with half the ears left in, the silage with plenty of good alfalfa hay will carry the majority of cows at full production during the winter months.

Beans and Peas.

Beans produces one of the cheapest grown summer feeds for cows. They

NAVEL ILL.

lying to a query as to a disease navel of young colts, the Farm- 'ribune says:

ır colts are suffering from navel ıich is a form of blood poisoning d by a bacterium that gains en- to the system through the chord at the time of birth. germ or bacterium multiplies in ıasses through the entire system animal. The germs usually af- he joints of the legs, especially stifle, hock, knee and elbow . In some cases the germs ap- to become localized in the liver ther internal organs. Ordinarily or less inflammation and dis- e from the navel accompany disease, which accounts for the chord breaking off in your case having carefully tied it with a g.

ere is practically no medical ment for navel ill. The only to do after infection has taken is to syringe out the navel with a good antiseptic, such as ree or four per cent solution of lic acid. In addition to this give nally one teaspoonful of hyposul- of soda, once a day. Also give tonic one-sixtieth of a grain of hnia three times a day. As be- stated, medical treatment will f little avail. Your colt may re- r but if it does the chances are ill never amount to very much.

ıvel ill is a disease to which we frequently called attention in e columns. Steps must be taken revent the occurrence of this trou- otherwise serious losses may en- The fact that our correspondent had two cases shows that his ı is infected and that it is not safe ıave any more mares foal therein, east not so long as it remains in present condition.

here are two ways of getting rid his disease. One is to thoroughly n and disinfect the barn, and the r is to put the mares in a new, n barn or else let them foal in pasture. The best thing is to oughly clean and disinfect the ı because the germs that cause disease in colts may also, under ain conditions, cause a form of d poisoning in older animals and s are on record where navel ill spread from colts to calves. In oughly cleaning and disinfecting ırn, remove all manure, litter, etc., destroy everything by fire that burn. Brush and wash down all webs; in fact, wash the entire in- of the stable with a five per cent ıtion of carbolic acid and then go over the interior with a whitewash containing five per cent of carbolic acid. Apply the whitewash with a spray pump so as to force it into every crack and crevice, which cannot be done by applying it with a brush in the ordinary manner.

It may be well once more to mention that before whitewashing great care should be taken to remove all particles of dust from the timbers, otherwise the whitewash will not stick and disinfection will consequently be incomplete. See to it that the mangers are thoroughly disinfected and be particularly careful that the walls near the floor as well as the floor itself are thoroughly cleaned and treated with whitewash. A wooden floor should be literally soaked, with a 10 per cent solution of carbolic acid. If the floor is of dirt from six to 10 inches of it should be removed and refilled with new dirt, or better still, cinders or sand. In all cases of infectious diseases, the sanitary value of a cement floor becomes apparent. Cement floors may be objected to on the ground that they are hard and cold, yet this objection, which can be overcome by a liberal use of bedding, does not compare with the sanitary advantages that this kind of floor offers.

After the stable has been thoroughly disinfected the horses themselves should be sprayed with a three per cent solution of carbolic acid. Great care should be taken to thoroughly wash their feet and see to it that the acid solution comes in contact with all parts of their hoofs, especially the frogs. Otherwise they will carry the germs of the disease into the disinfected barn and in a short time the disease will be as prevalent as ever.

Whether the old barn is disinfected or a new one is built it is a good plan always to be present when a mare foals so as to tie and disinfect the navel chord immediately after parturition. Where this can be done the disease rarely causes much loss even in infected barns. The correct way to do this is to tie a string tightly around the chord about one inch from the body and bathe the stump thoroughly with some antiseptic like formaldehyde, taking care not to get it on the skin of the animal. When a colt is born in the open pasture there is seldom any danger from this disease. The pasture, however, is for other reasons not a good place for a colt to be born, hence the best thing is to have everything in the barn in a clean, sanitary condition. It is a good plan to disinfect the stable once or twice a year on general principles.

KICK THE BARN DOOR.

One writer advises his readers not to kick the cow when they get mad, but to go and kick the barn door. A farmer may be considered insane who would kick the barn door, but there is about as much sense and a great deal more benefit to the cow in so doing than to give the cow a sound thrashing for something which she cannot reason out.

BERKSHIRE ASSOCIATION.

The proceedings of the American Berkshire Congress held at Nashville, Tennessee, Feb. 24, 27, is received, and it is full of interest to the breeders of the Berk.

The officers for the new year are, W. S. Corsa, White Hall, Ill., president; C. S. Bartlett, Pontiac, Mich., secy.; J. A. Leland, Springfield, Ill., treasurer.

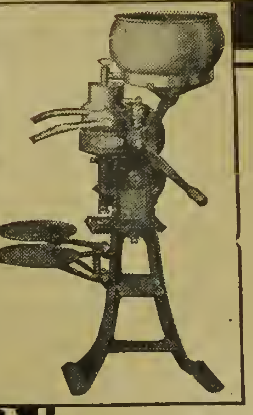
Cream Separators, all sizes, all prices. O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.



TEN YEARS AHEAD
OF ALL OTHER
CREAM
SEPARATORS

In skimming efficiency, simplicity, durability and convenience, the new 1908 Improved DE LAVAL CREAM SEPARATORS are fully ten years ahead of any other machine on the market today. Thirty years of experience, protecting patents, and the many valuable improvements devised and perfected by the DE LAVAL engineers in all parts of the world during the past three years, are responsible for this fact. Every feature of the DE LAVAL has been improved, from the supply can to the base. The new centre-balanced bowl with its separate spindle is alone a triumph in separator construction and must be seen to be fully appreciated. Then, there is the new one-piece "anti-splash" sanitary supply can, adjustable shelves for skim-milk and cream receptacles, new frame designs, and many other but less important improvements —all combining to make the DE LAVAL an absolutely ideal separator for farm and dairy use. There is the proper size machine for every size dairy from the smallest to the largest and no cow owner can afford to be without one of these improved machines. It will cost you nothing to see and examine the new DE LAVAL, and right at your own home too, if you will but say the word. Our new illustrated catalogue describing the DE LAVAL improvements in detail is sent for the asking. Write us at once and you will receive this interesting book by first mail with full information as to how you may have a free demonstration of the improved DE LAVAL at your own home. It will pay you to do so and your only regret will be that you didn't investigate sooner.

NOT A SPECIALIST.

te often there comes to the Cultivator from its best friends suggestions of changes which it is thought will greatly benefit and advance the interests of the paper. These, of course, are along all lines of development, and all have more or less of value. They are received most gladly and so far as possible acted upon. The more general complaint is, perhaps, along the line of particular departments not being as extensive as they should be. For instance, one day a subscriber from a citrus district will request more attention to be given to the culture of citrus trees, their marketing, and to prices secured. This great industry, which brings from $15,000,000 to $20,000,000 to the State, is well worth the increased space and attention requested.

Another day the raisin grower from Fresno registers his complaint and calls attention to the vast importance of the industry of that section and calls for more matters of interest to raisin growers. The same is true as to hops, as to cantaloupes, as to cherries, apricots and other deciduous fruits. The last, a gentleman from Tulare county who called only today, made an appeal for an especially strong presentation of matters of interest to the stock industry. He truly said the industry is only in its infancy and needs the education and stimulus which a strong stock paper could give to impress its importance and its profitableness upon the people.

California, as no other place in the world, is a country of specialists. The Middlewestern farmer is a type of a vast number of other farmers, possibly for hundreds of miles. In other words, they are general farmers. In California the citrus growers not only specializes on oranges, but often will even confine himself to absolutely one variety. Either the navel, the Valencia, or one variety of lemon. The same is largely true of the prune, the raisin, the hop growers or the poultrymen.

Now, while these industries are each worthy of a special organ to champion its cause, the one factor of financial support of such a paper is seldom sufficient to encourage it to specialize along its own line. Unfortunately, the newspaper man, like the stock grower, orchardist, or vineyardist, produces a newspaper for the financial return there is in it. Hence, until each industry becomes strong enough to support the special paper, the specialist must be content with a department in a general paper. As the support for this paper increases, these departments will be made as strong as possible to meet the demand, and all the time endeavor to stand by the general farming interests of the State in a way which will benefit them all.

Many papers supporting special lines have been started. Many have ceased to be published. The conditions have not seemed to favor that particular line of endeavor.

FRUIT CROPS.

Wishing a general idea of the condition of fruit crops and more particularly of apricots, we have written fruit growers in various parts of the State for information; from the answers we quote a few below:

As far as we can judge from reports sent in by various localities, the apricot crop throughout the State will be large, but as to what the probable prices will be, we are unable to say. If we get any information on this line within the next few days we will be glad to furnish it to you.—California State Board of Trade, A. L. McDonald, secretary.

* * *

There is probably two-thirds of a crop of apricots in this county. Some orchards are well set, others are not. As yet nothing can be said of prices. No buyers have been here that I have heard of. Probably prices will be good, as Lima beans and other products are now quoted at high figures for coming crop.—Wm. H. Cannon, secretary Ventura Chamber of Commerce.

* * *

Apricot crop good in this county, but can't even guess at the amount in tons. Buyers have not as yet made any prices for dried fruit of any kind; no 'cots sold green here. Peach crop good also. Cannery has ben paying $20 per ton for Elbertas, Muirs, Crawfords and Lovells, but have stopped buying at present. Prospect for raisins is fine, but a litle early to tell for sure.—H. G. Stearns, secretary Hanford Board of Trade.

* * *

The crop of peaches and of grapes very good. Apricots a fair crop; prunes a very short one. I have heard of no demand for green fruit, although apricots are turning and in a very few days will be ready for delivery. There is some inquiry for dried fruit; prunes are mentioned at 4 cents for four sizes; raisins 3½ cents; peaches 6 cents; apricots 7 cents. By reason of the insufficiency of rain the past three months, fruit will not have the size it had last year.—John Tuohy, Tulare.

* * *

The past four weeks have been very cold for the time of year, with cold and high winds. The crop of apricots promises to be a large one, but it is as yet too early to express a decided opinion as to the size of the crop, or the prices that growers will probably realize. The buyers are making no offers to speak of as yet, but the opinion in the best informed quarters is that the prices will range from about $15.00 to $20.00 for green and 6 to 6½ cents for cured fruit.—Geo. Robertson, Fresno.

* * *

What information I can get at this date shows a fine crop of 'cots in Orange county. Green 'cots $16 per ton. Cured 'cots 6 to 7 cents per pound. Buyers are not in the field yet with any definite offer.—J. A. Willson, secretary Santa Ana Chamber of Commerce.

* * *

We have a good half crop of apricots in this valley of very good quality, and the prices th being offered on green apricots are from $ $17. There are some offering of that kind These are also the prices that will probabl vail on free peaches, orchard run. Cling pe will most likely bring $25 to $27. Ther some being bought at those prices.—G. H. ters, Pomona.

* * *

Also from the press we note that, as a g thing, 'cots will produce heavily.

At Watsonville: The apricot crop of thi trict promises better than ever before, and present warm weather holds for a few days prove an enormous increase over results fo past several years.

At Chico: "The crop this year is of far rior quality to that produced in past years. chards that have yielded second-class pr will send it to a first-class market this ye

At Sacramento: "'Cots bearing heavily. small fruit will not be marketed."

The total output of the State is estimate 90,000 tons.

CO-OPERATE.

It seems to take a combination of orable circumstances to exasperate the pro and induce him to join with his fellows and his wares to market under conditions which bring him maximum returns. That was tr the orange situation in Southern California 12 or 15 years ago orange growers stood ruin staring him in the face which finally him to join other orange producers and org a co-operative institution, which is today largest and strongest of any of its kind. R men and prune men have likewise faced same proposition and for a time co-operated cessfully. Ultimately those organizations to pieces because of some unfortunate mist

Now, the poultry men of Sonoma county, is the largest poultry producing section, perated by the unfair treatment of commi men of San Francisco, have joined togeth now give promise of working out a satis marketing plan which will prove financia vantageous to all its members. Already co sion men have begun to take notice that ganization has more power than anticipated has accomplished much in securing fair in the larger markets of the State. It loo if this organization had competent manage and we trust all producers will stand as one behind this organization.

Keep the plow and cultivator going if you to keep your orchard in clean tilth. This son's weeds grow fast.

Shop Talk

POULTRY BOOKS—In our issue of April and 30th we gave a list of poultry books could be obtained through the **Cultivator.** to lack of space we have since been unable peat this offer, but judging from the orde ceived, we know they are wanted. The list tained books of great value to all poultry ra and were chosen so as to furnish a book de to any branch of the business. We cann scribe them separately now, but quote the n and prices. They can be ordered alone or the **Cultivator**, but in the latter case we can a reduction which is worth taking advanta Orders may be for either a renewal or a ne scription, but must come direct to the office not through an agent.

Agricultural Notes of the Pacific Coast

Northern California

Gridley is to have a creamery.

Winters is harvesting string beans.

Yuba City will have a heavy berry crop.

Wheatland promises a great hop crop.

Lodi will have a bumper Tokay crop this year.

Sutter county is to have a Swiss cheese factory.

First apricots were shipped out of Winters May 13th.

Interest is being created about Lodi in asparagus culture.

Peach crop is the largest ever known in Healdsburg.

Sonoma County Poultry Association held a picnic on June 6th.

California will produce $10,000,000 worth of sugar this year.

Nevada City farmers are reaping a harvest from coyote scalps.

Santa Rosa cannery has contracted for a large pack of apricots.

All fruits at Vacaville, excepting runes, will be an exceptionally heavy rop.

San Francisco has 20,000 more tons f hay stored than last year same ate.

Marysville grapes are coming on inely with indications of a heavy rop.

Marysville peach growers are hoping or $35 to $40 per green ton for lings.

Department experts are making inestigations about Winters in the soil urvey.

The Santa Rosa cannery is putting p large quantities of Royal Anne berries.

Late frosts did much damage to beres and many deciduous fruits in Pluas county.

Berry growers about Santa Rosa e planning co-operative shipping of eir fruit.

Some vegetables and more tender ants were injured in Sonoma county the late frosts.

Warm wind the last of May did uch damage to grain and other crops the Sacramento valley.

Sheep which have been dipped at avis have been inspected and have en found free from ticks.

There is less than half the number eggs now stored in California that ere were last year same date.

The produce from Marysville and ng the Feather river is now sent to n Francisco by the water route.

ome winter sown barley of Yolo unty is promising with only a half inch of rain after the sowing, a of hay per acre.

t is now estimated that 10,000 cars green fruit will pass through Sacnento this year, and that they will ng to the State at least $10,000,000.

Beet growers near Gridley claim t their sugar beet fields give exptionally heavy crops when planted other products following beat cultiion.

Humboldt county creameries report following prices paid for butterfat the month of May: United creames, 24 cents; Central, 24¾; Pioneer, ½; Riverside, 24½; Grizzley Bluff, ; Capital, 25.

Central California

Tulare county is shipping Valencias to Alaska.

Visalia is giving the good roads movement a boost.

San Joaquin valley new potatoes are being marketed in crates.

Chili peppers are being raised in the Turlock section for the first time.

Hanford claims to have an ideal situation for the production of apples.

The California Fruit Canners' Association uses each year 300,000,000 cans.

It is estimated that 75,000 sacks of potatoes will be produced near Turlock.

The promise is now for excellent prices for the Pajaro valley output of apples.

Sunnyvale Grange recently held a banquet in honor of the grange State Master.

Santa Clara valley is now sending out cherries and apricots in large quantities.

Some beets in Pajaro valley have been destroyed so that replanting was necessary.

Onion producers along the lower San Joaquin are reaping good prices from recent sales.

Porterville has a new tract which is said to be exceptionally well adapted to citrus culture.

The Orchard City Grange crop committee reports the last rain of much value to fruit crops.

The Spreckles Sugar Company has a force of men at work planting eucalyptus trees near King City.

All kinds of grain, especially oats, are looking exceptionally fine between Watsonville and Moss Landing.

Nurserymen, especially those at Fresno, report the past season one of the greatest in the history of the State.

Irrigation development in the Salinas valley has been very pronounced this season, several new plants being installed.

The Foothill Apple Growers' Packing House Company has organized for the purpose of shipping the apples of the members.

W. H. Volck, entomologist of Monterey and Santa Cruz counties, will lecture at the farmers' institute to be held at Davis this fall.

A Tacoma cattle buyer has bought a large bunch of cattle at Merced, shipping during the last month over 3000 head from that one point.

State Board of Health is making a vigorous campaign against the misbranding of fruits, and many fruits which are not labeled true to name are sure to come to grief.

Grain ranchers about Modesto are more and more using the Middlewest method of marketing grain; that is, of cutting with a self binder and then threshing from the shock or stack.

Last week we chronicled the destruction of trees by girdling at Porterville. Now comes Lindsay with a report that an orange grower has had some small trees stolen, being taken away bodily, root and all.

Kings county fruit growers are up in arms over a new contract which they will be asked to sign by the packers. At a meeting last week they entered protest and practically refused to accept the contract.

Southern California

Brawley is asking for a creamery.

Aphis has been a severe pest with melon growers this season.

There are said to be about 22,000 acres of olives in California.

Imperial valley grapes are already being shipped to Los Angeles.

Orange county received about $400,000 from its crop of beans last year.

Orange county's output of walnuts this year will be the largest in its history.

Riverside shipped a total of 4300 cars of oranges and lemons up to June 1st.

Ranchers in the Coachella valley are experimenting quite extensively with ramie.

Spanish peanuts grown in Orange county will command this season from 2½ to 3½ cents.

The melon aphis is not the serious pest in Coachella valley this year that it was last.

Some of the papers of the Imperial valley are protesting against the word "cants" for cantaloupes.

Imperial valley cantaloupes are now ripening very rapidly and shipments are in full swing.

One ranch in Orange county has over 2000 acres of grain which is yielding far better than expected.

An experimental plant of spineless cactus near El Centro is said to be growing at an exceedingly rapid rate.

A Redlands orange grower has invented an orange clipper which is pronounced to be one of the best and safest manufactured.

The cool, moist weather has induced some walnut orchards in the neighborhood of Anaheim to show some indications of blight.

Onion shipments are now going forward at the rate of five carloads a week from Coachella valley. The total for the season will aggregate 125 cars.

The latest from the desert is the effort to bud fruit trees on the wild mesquite, which are scattered all over the Coachella and Imperial valleys.

Coachella valley farmers claim that one acre in that section with abundant water will raise 10 tons of hay per acre, will keep ten hogs or two dairy cows.

The Tustin Packing Company is contemplating of the organization of a lemon association which will build its own packing house fitted for the care of lemons.

Los Angeles County Mutual Fire Association claims to be the best "dollar for dollar" company, and that it has saved the members over $200,000 during the last few years.

The Indio Experiment Station received 83 date palms from Africa last week. There were 21 varieties in the lot. There will be a further shipment of 175 received in a short time.

The million dollar improvement in the Imperial valley irrigation system is now put in the shade by a five million dollar proposition to carry a part of the Colorado river around on the northern rim of the Salton Sea and above sea level to a point near Indio.

The Coast

Rockford, Washington, is to have a new creamery.

Milton, Oregon, observed June 4th as strawberry day.

Colfax, Washington, has a hog weighing 702 pounds.

Even Portland receives several cars of Eastern eggs every week.

Strawberries near Spokane were seriously injured by frosts about the 20th of May.

The Hawaiian Islands are discussing the advisability of extending the forest reserves.

The Spokane State Fair is already pushing its arangements for the coming fall exhibition.

The Co-operative Company is being organized at Mount Pelier, Washington, for a new creamery.

The first strawberries of the season grown at Wenatchee, Washington, were marketed May 21st.

Eight hundred thousand fruit trees have been planted in the neighborhood of Colorado Springs, Colorado.

The creamery at Rosalia is making more than double the amount of butter than it did two months ago.

Hereford cattle breeders have lost an enthusiastic supporter in the death of Gov. John Sparks of Nevada.

Dayton creameries have been embarrassed by a shortage of milk, and five plants have already shut down.

Coast apple growers are jubilant over the biggest apple crop, with comparatively light crop in the East.

A fruit commissioner of Oregon reports that apple conditions are such that there will be a bumper crop this year.

Cow ponies and Western horses were given a test in an endurance race from Wyoming to Denver last week.

Frosty nights during the latter part of May did much damage to peaches, cherries and apricots at La Crosse, Washington.

"Jim Hill" mustard, tar weed and china lettuce are a trio of pests, which are troubling the farmers of Washington.

The Portland rose carnival, which was held last week, is said to have rivaled the famous Japanese cherry blossom procession.

The cold weather of the spring about Pullman has retarded the picking of cherries, which wil be much later than last year.

It has been demonstrated that alfalfa will be grown on many of the peet lands of Eastern Oregon, and its culture is being extended.

The discouragement over the low prices of hops has been somewhat overcome and Oregon hop growers now promise a great crop.

Eastern Oregon grain raisers are already finding that their communities are decreasing in population because of continual grain cropping lowering the fertility of the land.

Desiring a dozen perfect apples to present to Admiral Sperry when that section was visited by the battleships recently, Seattle called for a contest, and Wenatchee succeeded in carrying off the prize, and her dozen apples were presented to the Admiral on a silver plate.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

Starbuck's Barred Plymouth Rocks

We trap nest our hens. Why set from poor layers? Bird laying qualities are inherited the same as any other. This year we have discarded all old matings and have gone to the next generation. Cocks have 9 generations of 200 egg mothers. Hens all from 200 egg mothers and from cock with 6 generations of 200 egg mothers, and are laying fine. We have divided into pens according to the way they are showing up in six months laying. $2.50 for 13 eggs from first pen. $1.00 from 2nd. until they have time to make longer records. (Except from our one best, not for sale. We claim the world's Barred Rock, 6 months laying record for this one.) Do you wish to hear about our prize winning Buff Orpingtons and Silver Wyandottes? We have something to crow about. No Sunday sales or visitors. ***Wm. Starbuck & Son. Fullerton***

Trap-Nested White Wyandottes

That won 22 ribbons out of 25 and 6 Silver Cups and a carving set and a cut glass vase. All the National White Wyandotte Club Ribbons. Second on 10 pullet pen, contest open to all breeds. Mammoth Bronze Turkeys, winners of 5 blue ribbons, all at Los Angeles County Poultry Association Show, December 7, 1907. White Wyandottes were judged by H. Berrar of San Jose, Cal., and W. W. Browning of Ogden, Utah. Hens and Pullets, $15 and $20 per dozen.

COST OF PRODUCING EGGS.

THE cost of producing a dozen eggs varies with the locality, character of the stock and treatment.

The cost of producing eggs on a village farm from a small flock fed largely table waste is much less than from a flock where all feed is bought at market rates. Eggs may be produced at small cost on large grain farms where much of the feed is picked up by the hens.

From a series of observations reported by Prof. H. H. Wing of the Cornell Experiment Station on the amount and cost of food consumed and number of eggs produced during the four winter months by a number of flocks of hens in different parts of the State, we learn that in 17 weeks from Dec. 1st to March 29th, 29 flocks representing 10 owners and 5200 fowls, the average daily production of eggs was 22.8 per 100 fowls. During the same period the average cost of one dozen eggs was 18 cents. The flocks that laid the most eggs during December and January also laid the most in March.

The egg production of pullets was notably in excess of that of hens, particularly in the earlier periods when the price of eggs was highest.

The average cost of feeding 100 hens for 17 weeks was $35.33.

The average cost of product exceeded the cost of food by $16.33 per 100 fowls.

The cost varied much with different flocks and varied from six cents to six dollars per dozen. Examination showed that this remarkable difference in cost was not entirely dependent on breed, character of building or kind and quantity of food, although all these factors had an influence.

One cause of this difference seemed to be a difference in the hens themselves; some hens are good layers and some poor layers, just as some cows are good milkers, others poor. Poor cows transmit their poor milking qualities to their progeny. In a like manner we may believe that poor hens do not produce good layers. It is not sufficient that the poultry raiser give attention alone to housing, feeding fighting vermin, etc., but attention must be given to breeding birds that love the laying habit, otherwise time, labor and food may be wasted on birds that will not pay the cost of the food eaten.

THE CHICKEN MITE.

The chicken mite is generally distributed throughout the world wherever chickens are kept. It is especially active in warm countries, consequently those who raise poultry in California and adjacent States find it a very serious pest. If allowed to breed in the houses the stock becomes debilitated, falls off in egg production and readily falls a prey to disease.

The adult is light gray in color; in size about four-hundredths of an inch long; when filled with blood the color is decidedly red. Its habit is to attack the fowl at night, and hide in cracks or the underside of the roosts during the day. The presence of filth or the careless construction of buildings favors the multiplication of pest.

Experiments at the Iowa and M issippi Stations in combating chicken mite have shown that c liness is of prime importance. filth should be cleaned up and cr exposed. Poultry houses should so constructed as to furnish as hiding places as possible.

Painting the nest boxes and un side of the roosts and roost supp with crude oil, has been found a fective method of combating the ages of this pest, but it is neces that the oil be applied every tw three weeks to continue effective pecially during the warmer port of the year.

At the Mississippi Station houses were kept free from mite dusting freely every two weeks lime and sulphur. The Iowa Sta reports the best results with keso emulsion made of one-half poun hard soap dissolved in one gall hot water, let cool and slowly add gallons of kerosene oil thorou stirring. Dilute this mixture ten gallons of boiled water, if water is not soft, and apply w pump and drive the solution in cracks and crevices. The Iowa tion recommends that this applic be made three times in the sam in rapid succession.

Some of the eggs of the mite es this treatment, consequently the plication should be repeated at i vals of about three days for a pe of two weeks.

According to the experience of above station, the method is an pensive one. The material neces for spraying ordinary farm hen ho costs about 45 cents. Possibly i in California, as material is hi

THE BEST BREED.

The selection of a breed is freq ly a puzzling problem to the m woman about to embark in the po business, either on a large or scale, and failing to satisfy hims this point he makes the mista starting with several breeds, h thereby to secure the advantag all the good points of all the b involved. He never does.

There is no best breed. In s ing one should be governed by conditions and the end desired.

If the object is to produce eggs for a market that demands eggs, the White Leghorn or M holds first place. If broilers or roasters are wanted, nothing the White Wyandotte with their development and plump breasts, if there is no objection to a b egg, the White Wyandotte holds rank as an egg producer, prov the strain is one that has been to lay. The Plymouth Rock is a slower to mature, but possibly a hardier bird and so on down the no one breed has all the good po The Orpington may more nearly the needs and desires of one while the Rhode Island Red is breed yielding most pleasure and it to another.

Select a breed and stay w Aim to develop its good point

PROVIDING GREEN FOOD.

Green food in some form is an essential factor in egg production and in development of young stock where irrigation is practiced, green food is easily provided. Nothing is better than alfalfa cut green, but if the supply is limited hens must not be allowed access to the supply, as they will keep it fed so close that it may be killed.

A small patch may be protected by surrounding it with narrow boards and nailing poultry wire over the top. The plants grow through the wire and the chickens feed it off, but the wire protection prevents too close cropping of the plant—try it.

Kale may be planted in the early spring and will furnish a bountiful supply of green food; the lower leaves may be broken off and fed while the plant continues to grow. Swiss chard is another desirable source of green food.

Wheat or barley may be placed in a water tight vessel and allowed to stand 24 hours covered with warm water, then empty into a box that will allow the water to drain off. Sprinkle with water twice daily until the sprouts are one-fourth inch long, then spread in boxes in layers an inch thick; continue the sprinkling until the sprouts are of any desired length; by this method one can secure a very desirable supply of green food, especially for young chicks. Alfalfa meal or alfalfa leaves, if alfalfa hay is used, makes an excellent substitute for green material.

AROUND THE YARDS.

Do not attempt line breeding until you know what you are doing.

* * *

If you keep many breeds you cannot give the necessary time and attention to each one.

* * *

A change of pens, removing a hen from one pen to another, will check laying for a time.

* * *

Never allow anybody to induce you to change the blood of your flock by the introduction of a male bird of another strain, unless you are satisfied that he comes from a strain which equals your own as layers.

* * *

Whites of Eggs Thin.

Can you inform me through your inquiry columns why the whites of my eggs are thin and watery when being fried? Hens are fed on wheat or barley, have plenty of run on the ranch and plenty of oyster shells. Is it for lack of bone? They get fresh meat about once a week. Have 24 hens, White Leghorns and one rooster only. Wishing you prosperity with your paper, which is an instructive and interesting one to me.—A. L., Stevinson.

If your hens are eating freely of green alfalfa, it may influence the consistency of the white of the egg. The whites of very fresh eggs are more thin and watery than those of eggs a few days old. This may be the trouble with yours. I do not think the trouble is due to lack of bone, although you will doubtless find it profitable to feed some bone and meat in connection with the foods you are feeding.

A yearling or two-year-old turkey hen usually proves a better breeder than a young female. Therefore don't sell or market all of the older hens.

Coulson's Cresolene

LICE KILLER
DISINFECTANT
AND DIP

Dilute With Water Before Using

CRESOLENE is a powerful disinfectant, insecticide, and germicide obtained from coal tar. It is non-poisonous, and non-corrosive and will do no harm to the most delicate skin.

It mixes readily with water, forming a milky emulsion, and can be diluted from 50 to 100 times it own bulk, in accordance with the different uses to which it is put.

Thus when you purchase 1 gallon of CRESOLENE you can make up to 100 gallons of the best disinfectant for use with stock, poultry, dogs or as a general disinfectant and insecticide.

This reduces the cost to 1 1-4 cents per gallon which is cheaper than anything else on the market.

PRICES: Quart can, 50c; one-half gallon, 85c; gallon, $1.25.

Freight paid on orders of one gallon or more.

Irrigation and Forestr

A GREAT CONSERVATION PROJECT.

THE report of the Inland Waterways Commission contains the outline of one of the greatest engineering undertakings ever proposed; an undertaking which contemplates nothing less than the control of the water flow of all of the rivers of the United States.

This astonishing plan, which was drawn by Chief Hydrographer M. O. Leighton of the United States Geological Survey, provides for the regulation of stream-flow in such a manner as to prevent the present destructive annual floods and at the same time to insure a given minimum navigation depth to each stream during all seasons. It proposes to accomplish this so that it shall pay a reasonable direct interest on the investment while opening a new era of development in the regions affected.

This great achievement is to be brought about by building storage reservoirs near the headquarters of streams, governing the sources of its water supply. These reservoirs are designed to supplement the natural storage of the forests which remain in such watershed regions as the Appalachains and about the headwaters of the Mississippi. Such a plan, if adopted, will change the whole course of river improvement as heretofore carried on by the Government. Dredging and the building of levees would be done away with. Instead the reservoirs would keep back in flood times the waters of the Ohio, the upper Mississippi and Missouri, and the other streams of the great Mississippi system. The water thus held back would lower the stream below danger-mark. Later, when the danger of flood had passed, the stored waters would be discharged, maintaining the navigability of the stream through the dry season.

The cost of such a reservoir system adequate to regulate the streams in the Ohio basin is estimated at $125,000,000. To regulate the whole Mississippi valley in this manner would cost, it is estimated, $500,000,000. Taking as an illustration a single river which has been studied more carefully than some others, it is estimated that the regulation of the Monongahela in this manner would require the erection of eighteen reservoirs. Their effect would be to remove from Pittsburg, so far as the Monongahela is concerned, the present annual menace of flood and to increase the depth of the river through the dry season by five feet.

The money that would be saved from other expenditures and the prevention of damage by flood would more than offset the estimated cost of such a system, but more than that it would bring into the Treasury a direct cash return in the sale of water-power for industrial use.—American Industries for May.

PERMANENT ORGANIZATION OF GOVERNORS.

As has been expected ever since the proposal was made to hold in Washington a conference of the Governors, the meeting at the White House, May 13, 14 and 15, has attracted perhaps the widest and most serious attention of any gathering of public men that has been held in the history of the country. Forty-one governors, their advisers and the representatives of a number of national o
zations faced President Roosev
the famous East Room of the
House when the President call
first session to order on the m
of May 13th; and before the first
session was concluded, the o
had been advanced by a number
State executives present that
this Conference will grow a
nent organization of governor

Bees and Their Care

BE LIBERAL WITH THE BEES.

IT is very essential in beekeeping to be successful, to be liberal with the bees. What we mean is, to get he best results, it certainly pays to ive the bees the best of care with verything needed for their help. It certainly suicidal policy to stint the ees in any way, as liberality with hem in all things will give large reurns. Many in securing hives proure the cheapest hive that they can nd, even when getting the most odern hive.

There is quite a difference in what supplied with the modern hives. s they are now made, they have inrchangeable parts, but most persons ly secure just so much of a hive as ill answer immediate purposes, not oking ahead any for future needs. erhaps 75 per cent or more of the odern hives procured are the No. 1, the one-story and a half and most nerally the eight-frame hive at that.

If for comb honey, one should never ve less than two of the half bodies lding sections; while one half body plenty at first, as soon as the bees t well to work in that half story, other one should be ready and aced on the hive as soon as needed. is very poor policy not to furnish enty of room when needed, as the es cannot store surplus honey when ey have no room to store it, and bedes if they are crowded for room hen a good honey flow is on, they are ost apt to go to swarming, which ops any surplus storing, at least for e present. We have known bees to ore honey outside their hive because ere was no other place to put it, d their keeper did not seem to ow why they did so.

One beekeeper keeping bees in mmon box hives told us some years o that he had a swarm in his yard d that he noticed bees going in a ve placed right close to the hive ey were in; he thought that a new arm had gone in that empty hive. the end of the season when he nt to taking honey he opened this occupied hive, as it was early in e season, and to his surprise he did t find a single bee in this hive and t then discovered that the bees in e old hive had filled this hive with ney and then went back into their hive into winter quarters. He d that he got nearly 10 pounds m the hive they filled with honey.

Now, if plenty of room had been rnished in connection with the hive e bees occupied, they could have ne even better, as they could have rtainly done better in comb build- and storing where they could ve had the entire force to work at rather than in a divided condition they had to do. We have known er cases where the bees would ld and store under the bottom of stand where located.

Now, all this is certainly very poor icy to say the very least. We have o known of cases where bees were nfined to just the bottom story that y wintered in, and no surplus mber at all. The bees after arming, until hardly any were left, course, had nothing else to do, and man thus keeping them wonred why he did not get any honey, l it makes us wonder in all human son why anyone thus doing could pect any honey unless he were exting the bees to deliver the honey gathered, and place it in a jar or box in the cellar. We have also known of more than one case where hives have been placed upside down, and the bees run in the hive thus placed. We have taken several thus placed out and fixed them right, but it is a mean job. We had rather take them out of a log "gum." We use the 10-frame hive and all two stories and have a third story to put on when needed and have tiered them up to even four stories and had them all full.

If running for section or comb honey, perhaps two surplus stories will answer if one will take the honey off when filled, but if the honey is left on longer, it is ripened up better, or is made thicker by the evaporation the bees are able to give it and thus it becomes the most delicious of any sweets. If one is working for extracted, or what is more commonly known as "strained honey," one should always have at least one surplus story, making a three-story hive, and unless one can attend to the bees at the proper time another story will often come in handy and profitable. If extracted honey is well ripened before taken from the combs, it is as good as it can be even if left in the combs. Many do not like extracted honey; the reason mostly is: it is not well ripened before extracting, so it soon is off in flavor and so deteriorates.

We are aware that bee supplies are rather high in price on acount of the very high price of lumber, but because they are high is the best reason for any one to have them in as good shape as possible so as to get the most of the bees. We knew one man who would not secure any supplies until needed, and then he was not able to get them right off. We are sure it would have been worth $50 to him with a $5 investment at the right time.

We hardly think it necessary to caution any one not to be extravagant in their furnishings with the bees and give them more than needed. They should have only needed room at a time, and more added as needed. It is the "big" swarms that give the most surplus and swarm the least, and so pay the best. We endeavor as far as possible to keep our bees from swarming at all and divide for increase after the first honey flow. We had one swarm last season, but increased over one-third and got a reasonable honey crop also. Last season was not a good honey season, yet we got 87½ pounds of honey per colony—about four times as much as the most of the beekeepers around here.

We have told the story before, about how to secure the best results, and may tell it again, but will say now we can only get such good results by being very liberal with our bees and giving them the very best advantage not only in needed room in the hive, but by furnishing them with empty combs to go right to work when the time comes, or full sheets of comb foundation. This not only furnishes straight combs, but is great economy to the bees and also keeps the bees from making drone cells, which when used by the queen, a large lot of drones are reared which are consumers and not producers. If a very large lot of drones are in a hive, they might consume any surplus honey that the rest of the bees can secure; at least they will get a good portion of it. If it pays at all to keep bees in any way, it certainly will pay much the best to keep them the right way. J. W. Rouse, in Coleman's Rural World.

CONGO ROOFS
On U.S. Army Camps, Havana, Cuba.

CONGO
NEVER LEAK ROOFING
Sample Free

WHY CONTINUE to patch when a few rolls of Congo "Never-Leak" Roofing will put an end to all of that expense at very little cost over what you are paying for repairs?

You can lay it right over your old roof, it is so soft and pliable.

In these days of progress, articles which save *Time*, *Labor* and *Money* are what the busy man is looking for. And in Congo Roofing the three are most satisfactorily combined.

Congo will not leak or rot. It is pliable, non-shrinkable, unaffected by climatic changes, winds or water.

It is easy to lay, durable, and will give the most service at the least money. *Free Sample sent on request. Write today.*

that is high grade. Made like a carriage spring. Changes any farm wagon instantly into a spring wagon. Saves the wagon. Easier on the driver. Makes one wagon answer for two. Absolutely necessary where oranges, cantaloupes, fruit, etc., are hauled. Any capacity, 1000 to 12000 pounds. Prices the lowest. Illustrated Price List on request. Write today. Beware of imitations.

ARNOTT & CO.
112-118 South Los Angeles St.
LOS ANGELES, CAL.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Pear Leaf Mite.

Inclosed leaf is of a Bartlett pear tree, second year's growth. Same leaf is a fair sample of all others on the tree. I have other pear trees, but only one affected. Will you kindly advise me of what it is and what to do for it. Tree looks healthy otherwise.—Charles Grossholz, Napa.

The sample leaf enclosed is a case of injury caused by the pear leaf blister mite. Early applications of kerosene emulsion or the dusting of the leaves with sulphur have in a good many instances checked further progress of the mite.—H. J. Ramsey, Southern California Pathological Laboratory.

Root Knot.

Please give information as to how to remove olive root knot; also the knot forming at the crown of almonds and apricots.—R. G.

Remove the soil so as to expose the main roots for a distance of a foot from where they branch and chisel out all the diseased tissue. Allow the exposed parts to become dry for a few hours and swab the entire exposed surface with a solution of one pound of blue stone to ten gallons of water. Cover with soil immediately. This will give as much relief as is possible to get. Some of them will develop the knot again. Trees are never as good after they have contracted root-knot as those which have never had it.

Apple Crop.

Would like to know what are the prospects of the apple crop this year throughout the United States, as I am vitally interested in apples.—C. T., Watsonville.

We cannot itemize at this writing, but understand the general eastern crop will be very light. Oregon and Washington will be heavy. By another issue we may be able to give more explicit figures.

Potatoes for Cow.

My cow likes potatoes, and as I have a good many unfit for market and cannot carry them over for seed in this climate, is it advisable to feed them? What quantity should she have per feed?—W. O. S., Coachella.

Certainly, feed them to the cow. They are not a rich food, and if the cow is a heavy producer, she should have a little succulent food to balance up on. Ten to twenty pounds of potatoes a day can be fed with ten pounds of long hay, one to two pounds of corn meal or rolled barley. The potatoes should be fed slowly at first until the cow is accustomed to them. Cut them up to make square edges so that the cow can roll them around and not choke on them.—M. E. S.

Try Tuberculin Test.

I have a five-year-old Jersey cow that seems to be bothered with a cough, but very seldom bothers her except when eating her meals; otherwise, she is in very good health. I feed her alfalfa and oat hay mixed. It seems to be a tickling in her throat while eating and catches her very suddenly.

Kindly let me know through the columns of your valuable paper, as to what the trouble might be from my description and oblige.—J. S., Nordhoff.

We always listen for coughs in tuberculous cows while they are eating. Some never cough except at that time. Test her with tuberculin and if she does not react you may be glad.

Grafting Walnuts.

I have a walnut tree on my place that has been broken off by a runaway horse. Is it too late to graft scions on it and if not, can you tell me where I could procure a half dozen of the resistant to blight kind. I should like to try them on this tree.—H. G. D.

It is too late in the season to practice walnut grafting successfully. Grafts that are placed after the buds start seldom make a growth. Your tree may make sufficient new growth for budding in August or September.

We do not know where resistant buds can be had as all growers who have resistant trees are using them for propagating purposes themselves, but it is very likely many good trees will be found and their location made known this fall.—J. B. N.

Planting Corn, Sunflower, Etc.

Is it too late to plant large field corn, Kaffir corn and sunflower about June [illegible]?—F. J. S., Long Beach.

No. There is plenty of time yet for the development of these varieties this season. But the sooner they are planted the better chance they will have.—Q. A. L.

Cucumbers—Apricots.

My cucumbers turn yellow w about half the size of a lead pe and do not grow. The vines app to be healthy, and so far I have been able to discover any ins working on them. What do you th the trouble is? What is the earl known variety of apricots?—W. S., Coachella.

I have had this trouble some sons when the weather was cool, especially the nights. But the season advanced the trouble appeared and the cucumbers w develop in a normal way. This is only explanation I can give with more data than is given by corresp ent. I do not know the earliest riety of apricots. The Royal is us ly the first to appear in market, our large nurseries may know of lier ones.—Q. A. L.

Pringles and Newcastle are earlier than the Royal. Pringles i little value.

Veterinary

Dr. R. T. Whittlesey, veterinarian 714 East Seventh street, Los Ang will answer questions in this de ment. In writing of sickness or to any animal be explicit in giving s toms and particulars. Always en full name and address, but if assu name or initials are preferred they be used.

If an immediate mail reply is w enclose $1.00 for such service, but fo plies in paper only, no charge is if the answer will be of general inte

Itches.

Will you kindly tell me what t for my horse? She itches a good at least she rubs and bites her appears to be worse when w Have given her condition powders you can give me a remedy will much obliged.—E. G., Stevison.

Use the soap and coal oil emu in several of the late issues of Cultivator. Feed green feed if p ble; if not, feed alfalfa instead of hay. Give one tablespoonful of nesia sulphate in the ground twice daily.

GOOD YIELD AT ELK GROV

I am a patron of your paper, take enough interest to send an of a few returns from the fruit Elk Grove. I came from Illinois years ago and now have 200 acr a very pleasant home. We Elk Grove Tokay grapes to exc quality and quantity. Eighteen yielded 6200 crates which sold at per crate F. O. B. Elk Grove. A acre piece yielded 2860 crates sold at $.99 and another eight piece 3050 crates at $.95. A to culls per acre sold to the win $8.00.

Muscats sold as high as $2. crate and yielded very heavily. lot of 18 acres brought $18.50 pe and yielded eight and one-half per acre. Wine grapes yield f to 10 tons per acre and stand high in sugar.

Last year my four acres of p yielded $673.00, and 65 walnut eight years from the graft, brou $358.00. Almonds bear well four out of five and give a very heavy Alfalfa yields from five to six where irrigated, and is selling year, as it did last season, for $ per ton in the field.

We have a very fine orchard fo home use of oranges, lemons, o cherries, pears, apples and a s acre peach orchard whose crop last year for $2160.00. So we fee we don't have all our eggs in on et and we do have all the luxuri the Easterner would say. We a ciate the California Cultivator much in Elk Grove. E. S. Miller

WHEN TO CUT ALFALFA.

lfalfa should be cut when not
re than one-tenth of the plants
e come in bloom. Cut at this ear-
stage, the yield of hay for the sea-
will be much greater than if the
lfa is cut near maturity, and
ry pound of hay secured will be
th more for feed.
t the Kansas Experiment Station,
trip through a field of alfalfa was
when one-tenth was in bloom, an-
er strip was cut after full bloom
passed. The strip cut early was
rly ready to cut the second time
n that cut after full bloom was
g harvested the first time. The
p cut early grew vigorously
ugh the season. The strip cut
r full bloom gave a low yield the
cutting and did not grow suffi-
tly to yield a good second cutting.
ly cuttings invigorate the plant.
he late cutting of the first crop in-
s the plant more than at any
r time, and we have found it prof-
le to cut alfalfa the first time as
as one-tenth was in bloom, even
gh the weather was bad and we
that the crop would spoil in cur-
The increased yield from suc-
ling cuttings over that cut late
h more than makes up for the
of the first crop.

to Cure.

e leaves of alfalfa contain more
three times as much protein as
stems, a ton of alfalfa leaves con-
ing as much protein as 2800
ds of bran. Protein is the ma-
l in feed necessary for the for-
on of blood, lean meat and milk.
ry effort, then, should be made to
the alfalfa in such a way as to
all the leaves possible. The
od of curing will vary with the
ition of the crop, ground and
ther. When alfalfa has made a
growth, and at the time of cut-
the ground and the weather are
there is no difficulty in curing.
n, under these conditions, it is
to rake within a few hours after
ing, and stack a few hours after
alfalfa has been put in the wind-
s.
hen alfalfa has made a rapid
th, and is rank and succulent,
the weather and ground are damp,
problem of curing is a difficult
It is easy to dry the leaves,
the stems will contain much
ture after the leaves are too dry.
fa hay should become so dry be-
stacking that when a handful of
s are tightly twisted together no
r can be squeezed out. The
practical way to accomplish
and at the same time save the
es, is the plan to adopt, and this
vary with different seasons and
es.
ere is practically no difficulty in
g any but the first crop. When
conditions for curing the first
are unfavorable, we have usually
d the most practicable method to
o cut the alfalfa in the morning,
the dew is off, allow it to barely
in the swath, then rake, and be-
night put in narrow, tall cocks.
r the dew is off the next morning
the surface of the ground has be-
e dry, we open these cocks care-
, so as not to shatter off the
es. If the weather is favorable
hay may be stacked in the after-
; if not, we recock carefully, and
at treatment until the hay is prop-
cured.
me alfalfa growers, in stacking
the first cutting of alfalfa, put alfalfa and dry straw in alternate layers. This is a satisfactory way if the dry material is available. Others use ten to fifteen pounds of salt or air-slacked lime for each ton of hay, sprinkling the salt or lime so as to cover as much of each load as possible. Experiments made indicate that considerably less gains are made by cattle when salt is mixed with the feed. A trial of lime on alfalfa, made at this Station, showed little effect. From all the experience we have gained to date, we advise that the best way to prevent spontaneous combustion of alfalfa is to thoroughly cure before stacking. It is not often that all the conditions necessary to produce spontaneous combustion are present, and ordinarily there is no danger, where reasonable care is taken, except with the first cutting, and with this cutting only when the growth is rank.

PLOWING FOR AND SEEDING ALFALFA.

Great care must be taken in plowing up land to be irrigated so as not to leave elevations and depressions in the fields which will cause difficulty in getting water over the field uniformly and evenly.

The best method I know is to begin in the center of the field and plow to the outside all in one land. This leaves no dead furrows to fill up and only a very short back furrow unless the field be long; and if so, the plow can be set more shallow until the back furrow is made (say two or three rounds.) Then the plow can be set to its uniform depth by turning to the right. With a right-handed plow no ground will be trampled out and made hard on the corners; no dead furrows will be left in the field and a smooth, pulverized field will be the result.

The smoothing harrow should follow the plow closely to prevent the penetration of sun and wind from drying out the soil. To prevent the ground from baking, to pack the soil, to level the surface and to make a perfect seed bed for the small seeds about to be sown, go over the field once or twice more with the smoothing harrow.

After the seed has been sown, go once more over the field with the smoothing harrow to cover the alfalfa seed as shallow as possible.

The first irrigation should be begun when the alfalfa is an inch high and the barley stooled and shading the ground well. If the field is level one way and has a gradual slope in one direction, plow your ditches for irrigation through the field about one hundred feet apart, leaving a space at the lower end of the field not ploughed which will irrigate from the end of ditch. After the barley has been taken off the field irrigate the young alfalfa again and secure a cutting of hay from the new seeding the first year.—Irrigation Agriculturist.

The Northwestern Pacific Railroad, the picturesque route of California, traversing Marin, Sonoma, Mendocino, Lake and Humboldt counties, has ready for distribution, "Vacation, 1908," giving full information in regard to camping spots, mineral springs, resorts and country homes and farms to suit every purse and taste. This book can be obtained by applying at Southern Pacific and Santa Fe ticket office, Los Angeles, Cal.

DOGS.

SABLE AND WHITE COLLIE PUPPIES—Sires, Brandane Wishaw Squire and Glen Fana Bounder, litter brother to Aufield Model. Dams, Ormskirk Gloriana and Presidio Neille. $10 to $25; 2 to 8 months. GLENALPINE KENNELS, Grandville, Cal.

TREES.

FOR SALE—1,500 EUREKA LEMON TREES and 1,000 Washington navel orange trees, true to name. Also street and ornamental trees. Clean, healthy stock only offered. GEO. B. WARNER, SANTA ANA, CAL.

FARM LANDS FOR SALE.

FOR SALE OR EXCHANGE FOR ORANGE or Los Angeles Co. walnut land. Improved or unimproved 140-acre mountain fruit ranch; 20 acres apples and peaches; 15 acres grapes; 2 acres berries; 10 acres drained bottom land; 20 acres hay or corn land. Balance in timber. 10 living springs. 7-room house, 2 barns; 1 mile to school. Postoffice and station. Price, $15,000. WILLIAM RICHARD, Eccles., Santa Cruz Co., Cal.

FOR SALE—1 TO 10-ACRE TRACTS ON CAR line, between Riverside and new cement works; good for chicken ranches, alfalfa or gardening; will sell on easy terms; plenty of water on each tract. C. C. POND & N. R. BELL, Riverside, Cal.

FOR SALE—TWENTY AND FORTY acres, level, good land. Fine for chickens, berries, etc. $30 per acre. Very easy terms. No irrigation required. WM. MANTZ, Santa Maria, Cal.

A NEW IMPERIAL.

An event to take place within the next few months that will prove of the utmost importance and interest to the farmers and homeseekers throughout the United States and Canada, is the opening up for settlers of the valley of the Yaqui river.

This valley lies on the eastern coast of the Gulf of Lower California, about 275 miles south of the boundary line of the United States, and is on the Yaqui river division of the Southern Pacific Railway. The soil and climatic conditions are almost identical with those of the now world famous Imperial valley.

The work of taking the water out of the Yaqui river and distributing it over the 550,000 acres of land that comprise this valley is being rapidly pushed to completion and the owners expect to be able to offer the land to small investors late in the fall or early winter.

Owing to the fact that a great many thousand dollars are needed to complete these developments, it has been decided to offer a few thousand acres in large tracts of not less than 1000 acres each, at a price that will attract both speculators and the more conservative investors. It will be possible for the next 60 days, to buy 1000 acres at $12.50 per acre, and this price will include a permanent water right entitling the owner to use such water as he may require, at the rate of 50 cents per acre foot. O. A. Vickrey & Company, 308 South Hill street, have been appointed sole selling agents. Any further information may be obtained at their offices.

HARNESS FINISH.

To give harness a good finish saturate the leather with as much oil as it will take and then sponge the harness with a thick lather made of castile soap. When dry, wipe gently with flannel and follow in the same manner with a solution of gum tragacanth, which is made by boiling half an ounce of the gum in two quarts of water, boiling down to three pints, stirring freely while it is on the fire. When cool, apply it lightly on the leather.

Household Department

WORTH REPEATING.

"Now in the sunset glow I stand so near
The hills of light that all the past grows clear;
Even griefs transfigured in this softer ray,
Take on new forms and shine above my way.
With dawning triumph in the words I read,
'He taketh from us nothing that we need.' "
—Frances L. Mace.

"The little worries that we meet each day
May be as stumbling-blocks across our way,
Or we may make them stepping-stones to be
Of grace, O Lord, to Thee."
—A. E. Hamilton.

So others shall
Take patience, labor, to their heart and hand,
From thy hand and thy heart and they brave cheer,
And God's grace fructify through thee to all.
The least flower, with a brimming cup, may stand
And share its dewdrops with another near.
—Elizabeth Barrett Browning.

SHE KEPT HIM GUESSING.

THE girl with the big brown eyes and golden hair looked up engagingly. Candor was written large on her face.

"I always mean what I say," she insisted, reproachfully.

The young man sitting beside her in the secluded corner back of the palms tried to elevate his eyebrows in a superior way, but failed.

"That's what you say," he murmured, with the accent on the pronoun. "You're only joking. You couldn't be serious if you tried."

"Now, that is unkind of you, Harry," she said, in a grieved tone. "I'm sure I don't see why you of all persons should talk that way. You don't mean to say you don't believe me when I say things? I never had my word doubted before!"

"That wasn't what I meant," said the young man, uncomfortably.

"I should hope not," said the young woman. "Well, what did you mean?"

The young man lifted one foot and took a palm leaf betwen his fingers. "You know well enough," he replied at last. "Any one to hear you talk would think that you—er—thought lots of me, and you don't at all. You let me make an idiot of myself, and all the time you are having the best sort of time and laughing to yourself! Oh, I can see!"

The young woman sighed and shook her head. "You are so set in your ideas," she murmured. "By the way, do you think that when you asked me to mary you it was a case of your making an idiot of yourself? Because—"

"You catch a fellow up so," he complained. "I never knew anyone like you. All other girls—"

"That you've proposed to?" interrupted the young woman, interestedly.

"Certainly not!" said the young man. "There's no use trying to talk to you because you twist things around so. Maybe you think I don't mean it and that's why you won't be serious!"

"I don't see how I could be any more serious than I am," she said plaintively. "Here I let you take me away off in this corner, when I should be dancing with another man! He'll be so angry!"

"Let him," said the young man, savagely. "Besides, I don't know whether you came with me because you liked to be with me or because I'm such a joke to you. Do you treat everyone this way?"

"Harry," said the young woman, impressively, "I treat nobody as I do you!"

The young man scowled at her a minute and then suspicion arose triumphant. "I don't believe you do," he agreed, bitterly. "I suppose any other man would stand it. I'm easy!"

"If you are going to be hateful," she said sweetly, "you might as well take me back to the others."

"And let Smith have his dance? I guess not!" growled the young man. "I've no doubt you want to get rid of me and—"

She laid her hand on his coat sleeve. "Don't you believe I like you?" she asked.

"I don't know," he said gloomily. "Anyhow, I never knew a girl before who said she liked a man who—who tormented him so?"

"You have had so much experience," she said, shaking her head admiringly. "That's where you have the advantage of me!"

She met his unbelieving glance innocently.

"Humph!" he said at last. "I suppose no one ever paid any attention to you before! Oh, not at all! Besides, you're making game of me. I don't know much about managing girls. I can't seem to strike the right track. I wish I knew how to make you say yes."

"You don't look as if you had been losing sleep or missing meals through your anxiety," she said meditatively. "I don't think it can worry you much!"

"You don't know!" said the young man darkly. "I never cared as much about anyone before. I think about you all the time and you don't care whether I'm around or not!"

"Harry," said the young woman, "believe me, you are the chief joy of my life! I wouldn't miss having these little chats with you for anything! They are so—so revivifying! Really, I'm very fond of you!"

"Do you mean it?" asked the young man, with a struggling hope.

"Of course I do," said the young woman.

In the depths of her eyes he caught an instant's flash of an imp of mischief.

"Oh, pshaw!" he growled, getting up and walking back and forth. "You don't mean anything you say! Not a word!"

"It's so hard not to have you believe me," she said with pretty sadness as they left the corner, "when I am so much in earnest!"

"The deuce you are!" said the young man, hopelessly.—Chicago Daily News.

AN AUTOGRAPH COOK BOOK

A gift suitable to any time of the year, original, home made, one that will bring joy to any housewife's heart, is described in the April Woman's Home Companion. Have you ever thought of making an autograph cook book? It only requires a little care and patience to have a cook book filled full of original recipes of dishes fit for a king.

First, make a list of your intimate friends. Those noted for their good cooking and housewifely virtues of course should head the list. W

ch of them a personal note, ask-
iem to write out and send to you
favorite recipe. In each note
a stamped enevlope with a sheet
per of uniform size for the writ-
ecipe. Then wait.
sently in will come whole flocks
ite envelopes, each enclosing the
which is the particular pride of
articular housewife who donates
nd before long what a collection
ill have. When all the names
been accounted for, you must
work and bind the sheets into
k. Vellum makes a good cover,
a more serviceable one is de-
ooze leather, purchased at a
r shop, may be used. Red
r, lettered in gold or black,
well, and the initials of the
recipient should be added in one
. Just see what delight this
ill bring, and you will, I am
eel amply repaid.

NG PORK FOR HOME USE.

ve recently abandoned the use
pork barrel and now use for
og for a home supply of pork
lard tubs, which I obtain for 10
each. In one is put the hams
ny other parts wanted for pick-
nd smoking. In another, lean
and those adapted to bean cook-
e put, and the frying pork in
ier. A decided advantage found
is plan is the saving of trouble
g able to get at just the piece
without the necessity of hand-
er so much meat.

ask how you lost your hair?"
t it by doing too much but-
o other people's affairs," an-
the other passenger.—Chicago

RECIPES.

Potato Custard.

Boil and mash 6 large potatoes; add 2 well-beaten eggs, butter, pepper, salt and 1 cupful of milk (heated); beat until very smooth and light; add a little sugar and a dash of nutmeg. Lightly fill greased cups and bake a delicate brown.

Paper labels pasted on tin cans seldom remain long and cause great annoyance by dropping off. Get a small roll of surgeon's plaster to use for these labels and they will not come off. Washing soda is one of the cheapest and best kitchen helps. Use it to boil out the tea and coffee pots, dishtowels, in the boiler on washdays, and in washing all greasy utensils. Clean out all soot and ashes from under the top and the oven of the kitchen stove at least once a week, and it will always "draw" well and bake well.

Dried fruit should be put away in large cheese cloth sacks in a dry, airy room where it can be spread out, to keep it dry and from molding, as it surely will do if packed away in a small sack in a close drawer or dark corner of the pantry or store room.

Sulphur, which may be kept in tiny bags for the purpose, will drive away red ants.

Stop doors from creaking by oiling the hinges, or rubbing the edges with soap.

Put a teaspoon of salt into the lamps when filling them and they will give a better light.

Toughen new brooms by soaking them an hour in hot water, using a half cup of salt in the pail of water.

Paint can be removed with benzine, turpentine or gasoline when fresh, but these are of little use after the paint dries, when chloroform will remove some kinds.

HOMELY HINTS.

Strong sage tea with a little alum dissolved in it is an excellent gargle for a sore throat.

If you find a tiny break in the hot water bag, don't throw it away. Apply several coats of liquid court plaster and let each coat dry before applying the next. This will extend the usefulness of the bag, as court plaster is water proof and hot water will not melt it.

A teaspoonful of vinegar added to each pint of home made syrup will prevent it from candying after it stands. A teaspoonful of vinegar added to boiled frosting will keep it from being brittle and breaking when cut and will be moist for a long time.

Ugly marks caused by slits or cracked places on furniture are easily filled in with beeswax and the mark is never detected. In fact, this is the way furniture dealers cover such blemishes. First slightly soften the beeswax until it is like putty, then press firmly into the cracks and smooth evenly with a thin knife. Sand paper over the surrounding wood and work the dust into the cracks and smooth evenly with a thin knife. Sand paper over the surrounding wood and work the dust into the beeswax. This gives a wood finish or color and when the furniture is varnished the blemishes cannot be detected. It is better than putty, since putty soon dries, crumbles and falls out while beeswax remains forever just where it is placed.

Do we want to be strong? —we must work. To be happy?—we must be kind. To be wise?—we must look and think.—Ruskin.

Plan for Summer Comfort

Don't add the heat of a kitchen fire to the sufficient discomfort of hot weather.

Use a New Perfection Wick Blue Flame Oil Cook-Stove and cook in comfort.

With a "New Perfection" Oil Stove the preparation of daily meals, or the big weekly "baking," is done without raising the temperature perceptibly above that of any other room in the house.

If you once have experience with the

NEW PERFECTION
Wick Blue Flame Oil Cook-Stove

you will be amazed at the restful way in which it enables you to do work that has heretofore overheated the kitchen and yourself.

The "New Perfection" Stove is ideal for summer use. Made in three sizes and all warranted. If not at your dealer's, write our nearest agency.

The Rayo Lamp gives perfect combustion whether high or low—is therefore free from disagreeable odor and cannot smoke. Safe, convenient, ornamental—the ideal light. If not at your dealer's, write our nearest agency.

STANDARD OIL COMPANY
(INCORPORATED)

$16.30 buys this handsome six-hole Nickle-Trimmed Cast Range direct from the Manufacturer

without high shelf. With high shelf, just as shown in the cut, $19.97; large oven, six cooking holes, best quality of iron. Burns coal or wood. Handsome nickel trimmings. OUR TERMS are the most liberal ever made. You can pay after you receive the range. You can take it into your own home and use it 30 days. If you don't find it exactly as represented, the biggest bargain you ever saw, you won't have to keep it.

Write today for our beautifully illustrated Stove Catalogue No. 101-C. A postal card will do it. Don't buy until you get it.

The Produce Markets

Los Angeles Markets

LOS ANGELES, June 10, 1908.

Butter advanced 2½ cents early in the week and now stands at 50 cents. Market is remarkably strong at the advance. Much stock is going into storage and will continue to do so at such price, for it will prove profitable at that price. Actual selling price to trade is even in advance of quotations 2½ cents.

OUT WEST MAGAZINE.

A magazine of the old Pacific and the new, which has for years proclaimed that "the Nation back of us, the world in front" is the situation of the Pacific Coast. It is a product of the West which the West should be proud of and should give most hearty support. It is edited by Chas. F. Lummis and Chas. A. Moody. W. S. Dinsmore is treasurer and business manager.

This magazine is invariably filled with fiction with a local color and illustrations and descriptive articles of scenery and conditions in the West, and especially in California. The pungent writings of Mr. Lummis are always readable and always read. Disagree with him as one often will, yet there is that in his writing which calls one back.

The subscription price is $2.00 per year. It should be in every home.

Hay.

Somers & Co. say:

Shipments of hay to market c tinue to decrease in quantity, the tal for the week ending today s ing 2640 tons in comparison with last week and 3410 for the week ceeding that. The lessening in ments has been occasioned princip by the holders of old hay who been dissatisfied with the market who have temporarily withdra hoping for better prices in the future. We can see nothing that restore the old range of prices some time to come and we incli the idea that within 30 days from we will see a still lower range prices than that quoted today. prevailing high prices for the year or two have driven consider business from San Francisco. It just been reported to us that the ernment has just purchased 5500 of hay in Seattle for shipment to nila because of the prevailing lo prices there than here.

New hay is arriving, but sparin and as the market for same has yet been well established, we are quoting. In two or three weeks' it will probably be possible to about what figures will obtain for new crop during the harvest se Very little will be bought in the Francisco market unless the rang on a moderate basis.

UNCLE ZEKE SAYS—

Sum folks are so obstinate that they will even argue with persons who agree with 'em.

It's as hard fer sum men tu quit smokin' as it would be fer their wives tu quit talkin'.

Opportunity is about th' only kind uv a knocker everybody wants tu know.

If it's true that beauty is only skin deep, it would pay sum peepul tu do a little mining on their faces.

This is th' time uv year when an overcoat is both a necessity an' a nuisance.

More men thrust themselves on greatness than have greatness thrust on them.

A little credit is a dangerous thing.

—Journal of Agriculture.

No class of people can so well afford to have a neat, inviting dooryard as the farmer.

TWO FAIRY STORIES.

Continued from page 643.

dred years after that, or five hundred years after that; that we are just beginning a national history the end of which we can not see, since we are still young." In truth we are at a critical point in that history. As President Roosevelt has said, we are at the turning of the ways. We may pass on along the line we have been following, exhaust our natural resources, continue to let the future take care of itself; or we may do the simple, obvious, common-sense thing in the interest of the nation, just as each of us does in his own personal affairs.

We Are Trustees.

On the way in which we decide to handle this great possession which has been given us, on the turning which we take now, hangs the welfare of those who are to come after us. Whatever success we may have in any other line of national endeavor, whether we regulate trusts properly, whether we control our great public service corporations as we should, whether capital and labor adjust their relations in the best manner or not—whatever we may do with all these and other such questions, behind and below them all is this fundamental problem, are we going to protect our springs of prosperity, our sources of well being, our raw material of industry and commerce, and employer of capital and labor combined; or are we going to dissipate them? According as we accept or ignore our responsibility as trustees of the nation's welfare, our children and our children's children for uncounted generations will call us blessed, or will lay their suffering at our doors. We shall decide whether their lives, on the average, are to be lived in a flourishing country, full of all that helps to make men comfortable, happy, strong and effective, or whether their lives are to be lived in a country like the miserable outworn regions of the earth which other nations before us have possessed without foresight and turned into hopeless deserts. We are no more exempt from the operation of natural law than are the people of any other part of the world. When the facts are squarely before us, when the magnitude of the interests at stake is clearly before our people it will surely be decided aright.

HAS NOT DISTURBED BUSINESS.

Dr. Wiley insists emphatically that enforcement of the pure food law has not in any sense disturbed business.

"The great majority of manufacturers and dealers are absolutely honest," he declared. "They had nothing to clear from the pure food law. The dishonest manufacturer and dealer deserved no consideration. When I was at Jamestown, Va., some months ago, I urged the cotton seed oil men to label their product exactly what it was. They did so. Their business was increased immeasurably. The volume of business and value of the business never has been so great as during the last year. Our exports and imports exceed those of last year. Dividends $20,000,000 in excess of those of last year have been paid. Besides this wonderful prosperity, there has been a distinct improvement in the character and quality of food products."

The above may sound good to the Easterner who buys California dried at far lower prices than he otherwise could have done, but to the fruit grower at this end of the line it is not. Dr. Wileys' unwise management of this campaign has cost California producers a vast sum of money.

Kansas as a State, comes in for a good share of teasing about its long-whiskered men, etc., but, whatever may be her shortcomings she comes to the front with a record of having twenty-five counties without almshouses, thirty-seven counties without a single criminal case on the docket, and 85 out of 105 counties without a pauper. With all this in addition to a bad taste for oil trusts and grog shops, Kansas doesnt look so "worse."—Farmer's Wife.

Growing and Marketing Table Grapes

An Address by Mrs. Minna E. Sherman of Fresno at State Farmers' Institute at Davis

HE EARLY spring is beautiful in a vineyard country, "When the winter is past and the rain is over;" "the fig putteth forth her en figs and the vine with tender grapes gives ood smell." The view from a high building a vineyard with its orderly rows of vines, gests a great garden. The vineyardist that s out a vineyard with the rows crooked, re- es a word of reproval from every passerby, n the Chinese vegetable peddler up to the ist—all alike feel it to be a personal reflec- on the credit of the community.

ning.

would that more people realized the badness the pruning. The properly pruned vineyard are enough to make one pause and think the profits must indeed be great, if they be so wantonly sacrificed by lack of knowl- e of the grape vine's true character of wth.

ew land is frequently taken for a vineyard the vines do well. Still, if the land is in a ntry where irrigation is new, it is better to the water well into the land before beginning lant vines. If a field is summer fallowed summer and in the fall is plowed deeply n left ridged to take in air and rain; at the ng plowing it may be run into deep furrows well soaked with water, plowed, harrowed sown to corn, the corn watered twice dur- its growth and kept well cultivated. The is worked into the soil and the water held it by the constant cultivation. During the mer fallow time, if straw or manure is well ead on the land and it rots after it is plowed er, it greatly helps the soil in holding moist-

paration.

n land prepared in this careful way, a 98 cent stand of vines can be expected. The d year will give a crop under this treatment the vines will be as large as five-year-old s treated in the ordinary way. If this ns too slow, the quicker way is to put on a number of heavy teams and plow deeply, wing the plows with a subsoil plow, break- and without turning the raw soil on top. t the young vines and irrigate in a single ow close to the vine. In August, after the irrigation for the season, spread on a heavy of manure to retain the moisture. This ch will grow green with the first rains, and e a mass of green manure to plow under. covering of the land from the sun helps it ell, for after all, clean culture in our vine- s is the best, yet, while the vines are young sun burns out the land badly.

he worst possible practice is the common ake made by Eastern men. They reason in the East a clover field plowed under s the growing of other crops. Why not up an alfalfa field for the new vineyard? not? Because the practice is not good. close, unaired condition of the soil and the ing alfalfa roots in a dry climate do not help land. It must be gotten into good tilth first, lse the vines make a poor struggling growth e the ground is coming back to good condi- . It means at least two years extra work re the vineyard is profitable. Planting out cuttings directly in the vineyard has again me the fad. This is the second time it has e to the front among new growers since I had the craze. It is tried and then dropped and then tried again. Now it is simply the old idea of making a short cut and nature will not have it. The Italians are old grape growers and have this as a proverb: "Do nothing hastily but catching fleas."

A Bit of Advice.

If you desire to keep the friendship of your new neighbor, caution him against planting cuttings for a vineyard. I haven't any idea he will take your advice, but he will understand that advice is a good deal like quinine, more blessed to give than to take. The idea that cuttings make stronger vines than rootings, is not borne out when the cuttings receive the same care as the roots. Sometimes, a man gives the cuttings nursery care at a great expense for labor, and makes a great success. Let the same careful man plant roots and see what a vineyard he will have at the end of the first year. The ordinary care given to young vines will not, as a rule, result in more than an 80 per cent stand. Now, if a cutting vineyard only receives this sort of care, it will be about a 30 to 50 per cent stand and have to be filled out with rootings from the nursery. I know three vineyards planted with cuttings that have been a success; in every instance the cuttings received extra care, and it was after a wet winter. One vineyard the young owner planted while too wet to put a team on, and the little space around each vine was cultivated by hand until late in the spring. After all, in July and August this vineyard had to be irrigated twice and some of the vines watered by a cart. In speaking of planting cuttings, I must ask you to bear in mind that I am referring alone to Fresno and its surroundings.

In the vineyard the vines are planted at various distances apart, 8 by 8, 8 by 10, 8 by 12, 8 by 14, 10 by 12, 12 by 14; all have their advocates among the men that are planting table grapes. The men planting vines on their own roots near vineyards having phyloxera plant eight by twelve or twelve by fourteen, intending to plant a resistant root later in the wide way of the vineyard rows. If the phlyoxera never comes they are safe. If it does, they will think this will be a successful way of holding up the vineyard in its production. The men really fighting phlyoxera do not regard this as a good plan, but take up the vines of the infected spot completely and put the land into alfalfa for a term of years.

Fertilizer.

The use of fertilizers is neglected in many California vineyards. Indeed, I know men that say that it is time to sell out when the vineyard needs fertilizing, and allow the next fellow to try it. The size and firmness of the berry in table grapes, its standing up quality depends upon a well fed soil. Two years of good barnyard manure should be spread in the fall early, or if preferred, it can be put into a deep plow furrow after the first rains. The plows are run across the land set deep and back again in the same furrow until at least ten inches deep, then throw in the manure and cover with a couple of furrows. If this is done early enough there is little annoyance from the manure dragging out.

The third year, ground bone is dropped into the furrows and covered at the first plowing. At the last cultivation nitrate of soda is put into the furrow and covered. If the pruning of the vines has been balanced the grapes will set in large bunches and the wood growth will not be too great.

Varieties.

The varieties of table grapes shipped from California in large lots are Thompson Seedless or the Sultanina, the Sultana, the Malaga, Tokay and Emperors. Small quantities of Chonichons, Muscats, Black Prince and Rose de Peru are sometimes shipped out.

The Sultanina are fine grapes when well grown. The bunches are large and showy and the grape well flavored and sweet. As there is little culling or clipping on the bunches, it is a cheap grape to pack and shows up well in bunch packing.

The Malaga is a fine variety when it is good. It needs pedigreeing badly as it varies more in quality than any other grape we have at present. At first we all thought it was in the soil and condemned as Malaga lands the stronger lands. They seemed to fail to produce the sweet amber colored berry. We now find that the amber Malaga is a larger grape on the good soils, and that it does not vary more than a week in the time of ripening on the different soils. The green, watery Malaga does not ripen until Muscat time and is always to the taste deficient in sugar.

The Sultanina and Sultana are more expensive to produce than the Malaga owing to the fact that they require trellising to make full crops. The six-foot stakes are set a foot in the ground and a half foot from the top is placed the upper wire; two feet below it the second wire is run. Long canes are tied to the wires and the vine bears its fruits on the laterals springing from these canes. The Malaga is pruned half high, and after a time becomes strong enough to support itself. The stakes are then removed and used again to stake other vines.

The Muscat is not a shipping grape in most seasons, yet a few are always in demand in local or nearby markets. When raisins are normal in price, these grapes do not reach further than San Francisco and Los Angeles. The Muscat grape is not staked but pruned to a head close to the ground. Today, the general tendency is not to prune or to head the Muscat as low as in former years, hoping to increase the length of the life of the vine.

Tokay and Emperors are both high staked vines. This adds considerably to the expense of the vineyard. Stakes have been high priced these last few years. Now that the Government is selling timber, the small mill is likely to be able to make stakes once more. We may look for a reduction from the ruinous prices now prevailing. The cement stake promises well and after a few years' trial we will be able to tell if the unpreventable accidents in vineyard work will be too many to make it profitable. Poplar, willow and mulberry stakes are used by peeling them and at once standing in a solution of blue stone; after twenty-four hours they are ready to use. How long these treated stakes will last has not yet been proven.

Table grapes are usually well irrigated in the winter time, as they are often ruined by mildew when summer irrigation is attempted. Indeed, I regard it as folly to irrigate an old Emperor vineyard in the spring after the foliage has started. The years of deficient rainfall, the vineyards

A pool of apricot growers sold their last season's apricots at a net to the growers of 15 cents per pound.

With the Citrus Growers

GUM DISEASE.

WE were asked to speak on diseases of citrus trees at the recent Fruit Growers' Convention, and it was the intention to say a few words on the scaly bark form of gum disease, but most of the time was consumed in the general discussion of citrus diseases and the few minutes left prevented us from touching on this subject.

It was for a long time supposed that the disease was contagious and treatment was in line with the idea of preventing its spread. It is now supposed by many to be due to uncongenial conditions of the soil and that when these conditions are corrected, the disease will disappear. Just what constitutes these unhealthy conditions is not easy to explain, but the lack of humus and its general good effects on the soil and plants is given as the primary cause.

This is not only wholly our view of the case. We do not believe that the old groves of Southern California, that now show the disease, will ever be entirely free from it for any great or moderate length of time. It seems evident that many younger groves will develop the disease, no matter how well cared for they are nor how much humus is put into the soil. We are convinced that the scaly bark disease is a constitutional weakness in the individual trees and is aggravated by various adverse conditions of the soil. Primarily, the soil is not the cause. We base our conclusion on observations made on both old and young trees in both Northern and Southern California. There are thousands of trees of various ages that have the disease and are entirely isolated from other diseased trees. The roots of diseased and healthy trees have been intermingled for years, yet one tree is diseased and the surrounding trees are in apparent perfect health. Had the primary cause been due to poor soil conditions, all trees growing in these soils would be affected. In some trees the disease does not appear until they are perhaps thirty years old. In others it has appeared the second and third year. There are many cases where trees have become infected in the orchard when but two years old and when dug out, other trees planted in their place have never become infected. In several such cases we know that no extra care was taken to remove the earth for a space larger than was necessary to receive the tree and no special care thereafter was given. Still these trees have grown in these secondhand places longer than the first trees did and have shown no sign of gum disease.

In other cases, nursery trees have become badly infected with scaly bark gum disease while adjoining trees a foot on either side remained perfectly healthy. Still other cases are those which have developed extremely bad case of this disease after having had heavy green manuring crops grown among them for several years in addition to the application of other fertilizers. These cases are to be seen in Riverside and perhaps many other places; in fact, we do not know of a citrus growing section in Southern California where examples cannot be found.

If the above facts go to prove that the trouble is primarily with the individual trees, it does not seem that those trees which are affected or will become affected will ever be entirely free from the trouble even though they may be relieved and apparently cured. The cause is more deeply seated than soil conditions and the only way of securing trees that will not develop the disease is through selection. Elimination of specimen now affected is of no use to those who have sick trees. Selection of stock that is immune from this disease is, in our mind, the only safe method in securing an orange grove that will never be affected with the disease. There are groves in which it has never appeared but how long that will be the case no one can tell.

Immune Stock.

This term applies to the part of the tree above the bud as well as to the budding stock. It is well known that the Florida Sour stock is immune from this disease and also are many seedlings. In the case of the latter there are thousands of exceptions, while with the sour stock we know of none. In the Sacramento valley are many small family orange groves that are fifty or more years old and in none of these have any signs of the scaly bark disease been observed. Many of these trees are on land that is constantly moist from subirrigation and in many cases the trees have stood in flood water during short periods. These trees are seedlings of a different nature than the seedlings raised in Riverside. The latter have few seeds and they are small and not so well filled as are the seeds of the northern oranges. These have many times as many seeds as the Riverside seedling and the seeds are large and plump. There seems to be little difference in the growth and development of seedlings during the first year at least. Even seedlings from some of the most badly diseased trees in Southern California appear as strong and thrifty as those from the plump seed from the immune trees in the north. While it is no doubt important that the root stock should come from strong and immune trees, it is all important that buds be selected from immune trees of commercial varieties. There is every evidence that there are thousands upon thousands of such trees because there are as many which are growing thriftily among trees which have been diseased for many years while they are themselves in full vigor and free from the disease. To the ordinary thinker, it would appear that buds taken from healthy trees that have grown up with trees that are scaly with the disease, would prove the most hardy and free from the trouble, whether the trouble be constitutional or due to poor soil conditions.

J. W. Mills.

ANOTHER PRE-COOLING PLANT.

That co-operation is a complete success in California, is being proved to the satisfaction of members of the organizations, is plain. The orange growers have saved their industry and in addition have firmly established a great marketing system which is the wonder of the fruit world.

In addition to the system has been established a line of packing houses which are most complete in every detail.. A couple of these houses, Mr. Rumsey's at Riverside and that of Pomona Fruit Growers' Exchange at Pomona, have been described in the Cultivator. The following is from the

FRUITS IN PORTO RICO.

A recent American Consul and Trade Report, contains the following in regard to the growing of oranges and pineapples in Porto Rico:

Until the American occupation of Porto Rico there were practically no shipments of oranges to the United States. The natives possessed no knowledge of proper packing methods, and the duty was prohibitive. After the American occupation, the duty was reduced, which gave the industry an impetus and led a few American packers to commence shipping to the United States. Previously no citrus fruits were cultivated in the island, while at the present time it is estimated that about 7,000 acres are under cultivation, principally on the northern coast, between San Juan and Arecibo. The stocks are Florida and California, and the plantations are owned and managed exclusively by Americans. The principal yield, however, is from the native or wild orange trees, neither cultivated nor fertilized, which grows in the mountain regions, on the west coast in the Mayaguez and Aguadilla districts, and on the south coast in the Ponce district. With few exceptions, there are no regular orange plantations in the Mayaguez or Ponce districts, the large number of trees being found on the coffee plantations, where they were planted to give shade to the coffee trees.

These so-called wild oranges, like all tropical fruits, must be handled with the utmost care in order to reach the United States in good condition. This has been accomplished during the last two years owing to the improved methods which the packers have adopted in the picking, transporting and packing of the fruit. The season begins in September and lasts until about the middle of April. The Porto Rico orange is very sweet and of fine flavor, and the exportation of them has annually increased since the opening of the industry, amounting at present to 250,000 boxes a year.

Pineapple culture is increasing in the island, this fruit having been extensively planted during the past two years. The variety most suitable for shipment in a green state, packed in crates, is the Red Spanish, which originated in Cuba. This is the only variety which can be depended upon to arrive in the United States in good condition. There are now several canning factories on both the northern and western coasts, which are buying up all those varieties and grades which will not bear shipment in their original condition. This industry has been a very paying one to the planters for the past year, and promises to assume larger proportions.

With better transportation facilities, fruit and vegetable growing in this island will, no doubt, develop into a most profitable industry.

GIRDLED ORANGE TREES.

An orchardist at Porterville has just had a most unfortunate experience in the destruction of about 30 fine orange trees by a vandal too mean and low to live in a civilized community. Such an act is on a par with the ham stringing of a horse or the slashing of a harness, and calls for punishment far worse than can be given under our laws.

We do not know how serious the injury to the body of the tree may have been, but this experience recalls that of the writer several years ago, when a large orange tree loaded with fruit was gophered completely for 16 inches and supposed to be past saving. However, mud was packed about it and kept in a moist condition for some weeks and it was later found that the entire surface was granulated and later a new bark formed over the entire wound.

In the case of the Porterville trees, it is probable the wood was so injured by the use of the ax that such treatment may not have succeeded with them. But for the benefit of others this experience may be of value. Where a wound is higher on the tree we have known of the use of fresh cow droppings, which, when placed over the wound and bound on, have been kept moist, answered the same purpose even more effectively.

The RELIABLE DAYTON MOTOR CAR
Catalog free.
The first real successor to the horse
The Reliable Dayton Motor Car is not a luxury but a necessity because more ecomical efficient and rapid than a horse. Saves time—saves money. Simple to operate. Staunchly built of best quality materials and the only motor car on the market today which has actually proved satisfactory in year aronnd service—winter and summer—good roads and bad. Solid rubber tires, hence no punctures or tire expense. Twenty-inch road clearance. A Reliable Dayton Motor Car makes it possible to keep yonr horses in the field earning for yon. Will take you to town and back in one-sixth the time it now requires. Ready when yon are, for one mile or a hundred—requires no attention when not in use and eats only when you use it. Let us send our catalog illustrating and describing all models. Prices without top: 2-Passenger Car, $788; 4-Passenger Car, $925.

Deciduous Fruit Cultur

BUDDING GRAPES.

IT IS often desirable to change the variety of grapes on an old vine without destroying the top by grafting below the ground which is the only practical way to graft a grape vine. Budding during the active growth during the spring is easily and conveniently done. In the case of an arbor grapevine which has already covered considerable space and affords summer shade, the change in variety may be made with scarcely any loss of time or shade.

After the new shoots are about a foot long, there is a point where the tender growth will not snap when bent slightly and the bark will slip. At this point the bark may be slit and when the cane is bent slightly in at that point, the bark will separate sufficiently to admit a bud. The bud should be taken from a cane of about the same size and maturity as the new cane to be budded into. Cut the bud with the leaf stem remaining and part of the leaf about as large as a nickle. When the slit is made in the branch and the bark is raised by bending the part inward toward the slit, the bud can easily be slipped under the bark, the leaf stem providing a handle to place the bud with. The bud should be snugly wrapped with waxed cloth and left till the union is made. This can be determined after a few days without disturbing the cloth. If the bud takes, the leaf stem will gradually ripen and will fall off with a clean cleavage at the sucker. If the bud fails, the leaf stock will turn dark and stick tight. The wrapping should be removed in a couple of weeks or sooner if there are signs of binding. A good way to do this is to draw a sharp knife along the cane and across the cloth on the opposite side from the bud; this will protect the bud for a short time from the sun and relieve any binding. This should not be done till after the union has taken place and the bud has healed well. This takes place in not less than ten days, and two weeks is perhaps better.

After the leaf has dropped from the bud, it is safe to cut off the cane just beyond the bud and allow the latter to grow.

GRAPE VINES.

A French authority on grape culture writes that young grape vines should be cultivated deeper than old ones. The main roots that develop when the vines are young go deeply, but the feeding roots of bearing vines come near to the surface and too deep cultivation will prove injurious. These rules apply to heavy soils and that class above medium heavy, but sandy soils should be cultivated deeply all the time. It has been our experience in California, that deep cultivation in all kinds of soils is best for deciduous fruits. As a general proposition, it is the best in all cases.

The effectiveness of a mulch is determined by the depth or degree of fineness. If it can be made exceedingly fine, that is, like powder, three to five inches is sufficient in the coast regions, but in the interior six to eight inches is better for the reason that the soil gets very hot for several inches deep in the interior, and when there is sufficient moisture in the soil to supply the plants, it must come up to the mulch, and if the mulch is so shallow that the ground gets hot below it, rapid evaporation is the result.

There is some difference of opir as to the number of cultivations n essary or desirable to give the best sults in orchard or vineyard pract We have become convinced that w ly cultivation on some soils at l serves to retain the maximum amc of moisture. We have seen orange chards in which the cultivator kept going almost constantly, th and produce big crops year after y with almost half the number of gations required by adjoining grc which reecived little more cultiva that was necessary to put them shape after irrigation.

There is a great difference in c vators, in relation to retaining m ture. One with broad teeth set a angle that turns the soil over cultivate the moisture out of the but when the teeth are narrow, half to three-quarters of an thick, they will keep the soil stirred and not turn up any mois to speak of. Those cultivators teeth as wide as two inches shoul made over for they are a poor and lose more moisture for the chardist and vineyardist than save. Any kind of teeth can be on any kind of a cultivator. T your machine to the blacksmith tell him to fit it out with steel t not over three quarters of an thick. Harden the points as har possible and leave the balance of tooth soft so that if they catch c root or rock they will bend and break the points. If the teeth made of steel half an inch thick two inches wide and set to run e wise, they will be strong enough W. Mills.

TABLE GRAPES.

Continued from page 667.

should be irrigated in the winter cultivated to hold the moisture.

A Good Seller.

The Tokay grape has brought r money into the State than any o table variety shipped out, for its age is very great. Like the Emp it grows well on heavy, shallow It is a handsome grape and a carrier. I really think that both kays and Emperors taste bette New York than they do in Califo The Tokay colors highest when heat is not too great. Where climate is cooler than one in the temperature clings lov around a hundred degrees for after day. The last season in Fr was favorable to the Tokays, an packing houses sent out well-co fruit to the East.

The Tokay color could be re improved in the hotter portion o State by a little selection. I worked the Emperors most succ ly by pedigreeing them. This is by using only cuttings from ma vines that had produced for two sons a reasonable amount of class grapes; large berries, high ored and large bunches only were sidered. The vines were large a was easy to get more cuttings th cared to use that were first clas every respect. The output of chantable grapes was increased three and a half and four tons t acre to eight, nine and ten tons; culls were reduced to a minimu

The vines must be kept clean. ally keeping a vineyard clean, th keeping down the weeds, is all th it necessary. The vines them- should have the fungus growth off and dead knots removed, pray tne whole vine heavily with aux mixture just before the swell. Clean up all the trash the vineyards, leave no place d mildew spores or thrips or rs. All these can be controlled ping down their breeding places. vines need sulphuring then it begin while the leaves are mall and again later at the blos- g time. The suphuring machine uccess. It blows the sulphur it is needed and wastes none. refore, reduces the amount need- reatly. Red spider and purple sometimes show up late in Au- spraying with cold water con- these. Usually they are simply one and the next season the are given more water in the win- me as dryness is thought to be ause of the rapid multiplication se pests.

mperor.

Emperor grapes have been our ss and the high prices received is crop have induced planting all the country. Many are unsuc- l. Some from poor quality of the they planted, some from summer ion and some from bad pruning. pruning is often merely "go as lease process" and never two alike. I often wonder that the bear at all. Then I look at my vineyards and think: "It is a preacher that follows his own e," I cannot get the pruning done y except I stay right there and a few careful white men at work. l mistakes in the years as they we learn what not to do with the .

e same experiments we all tried n years ago are being repeated will prove unsuccessful again. I d half an hour to one grower who about to plant Emperors. He a man above the average in intel- ce. Indeed he came to me for ad- After all, when he went away aid he would plant his Emperors feet apart and trellis them. I up, as I had hammered in the ght that tonnage was not wanted shipping grape, but quality.

e Red Emperors bears its large ters of high-colored grapes on tne n of the vines. Large bunches of dark fruit sold as Emperors are etimes produced at a distance n the head of the vines. The more vine has laterals, the more little k grapes will it bear. As every l produced taxes the vine as well the land, it is folly to produce a of worthless little grapes that the ery will buy cheaply. With long lised pruning the Emperors will luce immense tonnage of cheap , worth, say, seven or eight dollars n; or the same vines will produce, proper pruning, a minimum crop ruit worth fifty dollars a ton. ther the vine nor soil is taxed to luce the crop.

he Emperor grape cannot be rec- nended to careless growers. Year r year, a well cared for Emperor yard planted from selected vines, small mint to coin money. The pes are as beautiful in their soft, monious, jewel-like coloring almost a begonia. The Emperor is a good pper and stands considerable rain le on the vines without damage to shipping qualities. It also holds well in cold storage.

Growing.

The market for table grapes grows constantly. I well remember when six cars of Emperor grapes was all I could sell on the New York market, and then the seventh car slumped badly. The day of the ventilator cars made shipping risky business, and returns were considered good at a thousand dollars a car. Now we look for two thousand or more a car for the best grapes. I expect to see the better quality of grapes, those we like to eat, go to the Eastern market under the improved ways of handling. The pre-cooling of the fruit before it enters the refrigerator cars will greatly help the grape shipping trade.

Pretty Girl Faces.

The love of fruit packing grows on one. I was never as happy as when with the girls and women in the packing house. The eye was feasted witn the marvelous beauty of the grapes, almost as sweet as the pretty girl faces bending over them. That is past—today we have Japanese. They are not pretty, neither is their work pretty. If they would try they could do better, but they simply will not try, I often watch them strutting around, proud of the Lord only knows what. Yet, not too proud to accept unearned money. The thoroughness they showed in the late war as soldiers makes us know that they can do their work well, if they are willing to learn The bloom has gone from the packing house and it has become drudgery. The shipping grape is like the Bartlett pear, easily damaged in handling. The grapes should never receive the slightest jar in handling; cut and held by the stem and laid lightly one bunch at a time in a large sweat box—this is the only way to preserve their bloom. The sweat boxes are well padded by a thick layer of hay under the papers, to give the grapes a soft bed to ride on. These boxes are hauled on wagons with springs, and the vineyard roads have the ruts and "thank you moms" smoothed over and tramped own to save jolts. Steady, slow horses are used to draw the wagons to the packing house. The sweat boxes are lifted by two men on and off the wagons. They are stacked log cabin fashion to leave plenty of space for air; after twenty-four hours the stems are limber enough to pack.

In Emperor packing a girl or two spends her time in picking out the clusters from the large boxes before they are carried to the ordinary packers' tables. The cluster fruit is carried by the stem carefully and laid on paper in other sweat boxes at the packers' tables. Sometimes half the packers are at the cluster tables. The ribbons on a ten-car pack will cost a hundred to a hundred and fifty dollars. The ribbons should be tied and then the bunch tied on the stems of the grape. The ordinary packers will trail the ribbons over the grapes and injure the bloom. I sometimes find a girl who is an artist in tone work; and when I find one, she alone puts on ribbons.

Ship in Bunches.

The ordinary packers must not be allowed to cut the grapes up into little bunches to make the top of the crates more even. This is the easiest way to top off a poorly filled crate, but it is inexcusable in a foreman to permit it. If the packers are trained to fill the corners first of the basket, then fit in a center bunch, the tops will come out smooth enough and the basket will be full weight. The fruit in each crate should be even in size and color. The packers seem to think that it is doing the owner a favor to fill the basket as rapidly as possible without regard to doing well. When one can bend this enthusiasm to careful work, it makes for goodness. The lack of skill in using the fingers, as well as the color blindness, makes one wish that every child could have a kindergarten training.

"Send More."

The early fruit packing, for it is seventeen years this week since I first began to pack fruit on the ranch, the early fruit packing was pioneering. We had none of the ideas now common. The grapes were clipped up into little pieces and faced into a form, they came out of it as evenly surfaced as cherries and without any bloom on them. It was not a pretty nor appetizing looking pack. The first year they went in like that to the market. The next year I rebelled against cutting up the large bunches, and to make the basket larger, cut down a side and put two together tacking the cut sides to the bottom. Then I tied on a few pieces of baby ribbon left from the year's Christmas packages. When the grapes reached the East I reecived a telegram to send more. It has been more! more! Like little Oliver Twist, the demand is still unsatisfied.

The early commission men argued strongly against the shipping of the large bunches in this way, as the crates were lighter and took up too much room in the cars. I knew this was not reasonable for I had lived in the East and knew the trade could charge well for that brilliantly colored fruit. The women in the East were willing to pay as much for it as for flowers; for the fruit not only decorated the dining table, but it became a part of the dessert. In the season of the year that Emperors are in market ten dollars provides only a few flowers for a dinner party, hardly enough for more than a simple affair. These grapes, when arranged under an electric light rival hothouse flowers in their effectiveness. These first large baskets were a surprise when they sold for three and a half dollars and up, a single crate. The old double crate we never used except in emmergencies. The consumer was asked to buy a "pig in a poke," and as we had nothing to be ashamed of in our pack, we felt proud to pass him the single crates, so he could see that his "pigs were in clover."

In a packing house, a woman is better to oversee the women workers; while a man can best put up with the Japs, as he has more patience with masculine stupidity. If any women at all are employed, a sensible forewoman will hold things in order and suppress the little snippy fresh youths that come out as floor boys. They are usually smarties rather than vicious, but little gnats are often more annoying than bigger beasts. If a packing house is to hold conscientious women packers, it must be high toned in its personnel. The bloom must be kept on the workers as well as on the grapes. It is the bloom that makes the Eastern agent smile when the crates are opened up. It is the bloom on the workers that makes work a joy,

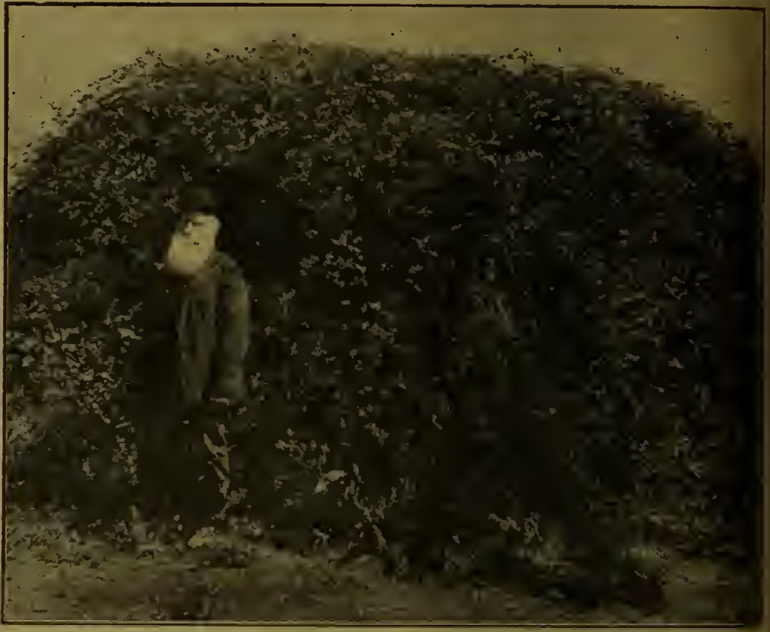
POTTER VALLEY'S WONDERFUL BLACKBERRY BUSH.

I SEND you with this article a photo of the largest and most prolific blackberry bush that I ever saw or heard of. If there is another blackberry bush on this coast, or in the United States, that equals or exceeds it in size and bearing qualities, I should like very much to hear of it through the columns of your valued paper. It is of an oval form, eight feet in height to the apex, sixty feet in circumference and greatest diameter, crosswise, 18 feet.

It is growing on rich alluvial soil, and I am informed that it has never been fertilized nor irrigated, and all the pruning it has ever received was to merely cut off the long, straggling branches on the outside once a year.

My daughter and I picked fifty pounds of berries from this bush the latter part of August, 1908, and we scarcely missed them from the bush. This was after many others had picked from the same bush. I picked three pounds standing in one position. I could have picked double that amount if I could have reached into the bush further, but the entangled branches with their sharp thorns prevented me.



I am fully satisfied that this wonderful bush bore at least two hundred pounds of berries that season, and the lady that lives on the place where it grows, says she thinks my estimate is within bounds. The sun damaged the berries very much where they were fully exposed, especially on the south and southwest sides, and consequently many of them were quite small, while those that were partially shaded were of medium size and very sweet when fully ripe.

It is my opinion that if this bush were properly pruned, fertilized and irrigated, as well as shaded somewhat from the extreme heat of the sun in July and August, that it would bear between three and four hundred pounds in one season. I am informed that it was brought from Santa Rosa when very small and was known there as the Evergreen blackberry.—Ira W. Adams, Potter valley.

Do not fail to sow a patch of spinach in the garden as soon as possible. It comes quickly and makes nice "greens." A patch of turnips serves the same purpose and many people prefer the vigorous flavor, with its slightly better taste, of the turnip greens to the spinach or kale.

COPPER FUNGICIDES.

Extensive experiments by som the Eastern stations show that t is quite a difference in the adhe ness of different copper fungic The solutions used were two per and three per cent for Bordeaux one per cent for verdigris. E gallons per acre were used for first and 100 gallons for the fo spraying. The experiments were ried on in nine different districts the results showed that verd ranked first in adhesiveness and came a combination of verdigris, deaux and Masson's mixture. All mixtures were more adherent w applied fresh. Bordeaux mixture serves its adhesivesess when the perature is high while those w contain soap lose their adhesive when the temperature becomes l

The Ornamental Garden

THE ASTER.

ASTERS, or Michaelmas daisies as they are commonly termed, are perennial herbaceous plants blooming during the late summer and autumn months. The genus is a large one, over a hundred species being known. Most of the species are of little account as decorative plants for the garden, while others, and varieties raised from them, are worthy of a place in most gardens. The principal objection to many asters was their long and straggling habit of growth, but most of the kinds now generally grown are dwarf and compact. The range of color is not wide; the majority of the species and their varieties produce flowers of shades of blue, lavender and purple, a few bearing white flowers. The plants are hardy and very floriferous, and are specially suitable for mixed groups or borders where they supply a quantity of flowers of unusual and pleasing shades of colors at a time of comparative scarcity. The flowers are valuable for decoration, lasting well when cut from the plants.

The genus aster at one time included many shrubs, herbaceous perennials, and annuals, now referred to other genera, including Callistephus commonly known as the China aster. For the purpose of these notes the China aster may be referred to, as it is unlikely that it will be known under any other name than the present common one. A number of varieties of the China aster have been raised by florists, many of them being of exceptional merit. They are favorites with numerous gardeners, amateur and professional, although their season of blooming is comparatively short. Many diverse forms are obtainable, and the general habit of growth of the best varieties is neat and compact. The flowers are valuable for decoration, lasting well in water.

Soil and Culture.

The cultivation of the perennial asters is exceedingly simple. They will thrive in any fair garden soil, having a preference for soil that will be cool and fairly moist during the growing season. They will grow fairly with a little attention in the matter of manuring and watering, but repay any special care in those directions. In fairly rich soils and situations, where they are allowed room to expand, they will not require to be removed and replanted for several years. In poor soils, and under hot and marsh conditions, it is advisable to lift the plants and transplant into manured soil each season. The usual method of increase is by division of the parent crown in autumn or spring. A small division will develop into a fairly large plant during the season of growth. Plants may be struck from cuttings in spring, but this method is rarely practiced except by nurserymen when desiring a rapid increase of a scarce kind. New varieties are raised from seeds, which should be sown in light soil in spring. Seeds saved from some of the newer hybrid kinds may produce varieties varying in some respect from the parent. The general cultivation of the perennial aster during the growing season consists mainly in keeping the soil fairly moist during dry weather, and training the plants to stakes where necessary. Tall growing varieties may be cut back when about a foot in height, which will have the effect of dwarfing them a great deal.

The China asters are annuals, and must be raised each season from seeds. They are classed as half-hardy, a classification that denotes inability to resist normal winter conditions. Seeds should be sown in spring, March and April being the most suitable months for these and most annuals of a like nature. To get good results, seed should be sown in boxes of light soil, and when the young plants are fit to handle they should be transplanted into boxes or beds and grown on for a long time, when they should be transplanted into their flowering quarters. The first transplanting insures sufficient room for the development of the young plants; while, if left in the seed beds or boxes until the time came to transplant them into the beds or borders, they would unless sown very thinly be drawn and weakened. To attain something approaching perfection the China aster requires a good, rich soil, well drained and prepared, and a fair supply of water during the growing season. Under suitable conditions some of the strains produce flowers of great size and beauty. Where water is scarce a mulch of manure will assist materially in the development of the plants. After the flower buds are formed it is advisable to withhold water in a measure as the flowers are liable to "damp off."—Journal of Agriculture of Victoria.

UNCOMMON, BUT GOOD VINES.

While too much variety is generally productive of an unsatisfactory effect in the case of flowers, shrubs and trees, unless the design is extra good, variety in vines is something much to be recommended. Whether a place is covered with one kind of vine or many, the effect on the eye is the same. There is a good, pleasing mass of foliage. But to the owner of the place too much of one vine, such as honeysuckle, woodbine, clematis, etc., often becomes monotonous.

There is no reason why many different kinds of vines should not grow over the same place. Most vines are "tolerant;" that is, they get along pretty well together.

Among the good, swiftly growing vines that are not generally known is the Japanese Akebia quinata. It is free from insect foes, grows very fast and has beautiful leaves that unfold early and stay late. It has spicy, brownish flowers in early spring and gets along very well with other vines.

For low verandas or trellisses, there is a good vine known as the Chinese Matrimony vine (Lycium Chinense,) which has bright purple flowers that are succeeded later in the season by brilliant scarlet berries. The Bignonia Grandiflora, or trumpet creeper, has rich orange-scarlet trumpet-shaped flowers. If it is pinched back when it has gone as high as you wish it to grow, it forms a thick, shrub-like head.

One of the most prodigious growers of all is the Kudzu vine, a Japanese importation, which has the peculiar name of "Jack and the Beanstalk," on account of its swiftness of growth. Its foliage is large and lobed, and late in the season it bears pea-shaped purple flowers in clusters.

EUCALYPTUS WOODS.

An instructive showing of the wood of many varieties of Eucalyptus is made at the store of the Morris Snow Seed Company of Los Angeles. It is proof that but few in the State know the beauty of the wood of these trees. Strange as it may seem, the wood of the ordinary blue gum is one of the handsomest of the lot and at the same time one of the hardest and apparently the strongest. One of the most striking panels is a curly piece of the ordinary blue gum.

There is a great future for California in Eucalyptus culture and the land owner who studies into the possibilities of the various varieties is wise.

Buying Experience Now.
Will Buy a Separator Later.

That's the man who parts with his money for a Mail Order House Separator.

He can't get dairy service at the price which they ask. They can't supply dairy service for that money.

Separators that separate and keep on giving good service are not sold by Mail Order Houses nor at Mail Order House prices.

Ask any successful and experienced dairyman whether this is correct.

Inquire what separator the successful dairyman has—you won't find a mail order machine.

Ask the dairy colleges or agricultural departments of the various states—they don't use mail order house separators.

Prof. C. E. Lee, of the Illinois Agricultural Department, says: "I desire to warn you farmers against buying hand separators from the mail order houses. You will regret it. The machines do not give results—they do not last—they fall all to pieces."

Take a look among your neighbors. Who has most trouble? Who has most repairs? Who has changed separators? What kind goes out when changes are made? Generally a Mail Order House separator is at the bottom of the difficulty, isn't it?

Good experience is worth something, but the Mail Order House separator experience is very dear at any price.

Do you want to buy a separator or experience?

Those who buy Tubulars get separators and satisfaction. They who buy Mail Order House machines get experience, and when they want separators have to part with more money—even though the change and extra cost are profitable.

Send for Tubular Catalogue No. 260 free. It tells you why Tubulars are best.

ODDS AND ENDS.

THIS IS the season of growing, when the grass putteth forth anew her green leaves. The droning, whirling sound of the lawn mower is heard all day long. Naturally the family cow receives, as a treat, the short clippings from the lawn. Then comes letters and post card to the "cow editor" full of trouble over the clippings making "Bossy" ill. Some correspondents blame the trouble on the neighbor's dogs for carrying old bones and highly ripened meat to the lawn. While these morsels, dainty to the canine heart might be very objectionable if fed to a cow, the actual fact is that the cow will reject any grass that is flavored with tainted or flesh foods. In some cases the indigestion is the result of overfeeding or gorging on green food, the sudden change from dry feed being more than the cow's stomach can endure.

Bloating.

Gases form, colic or bloating comes on and the cow must be relieved by doses of bicarbonate of soda, administered in a little warm water. If she is too bad for this mild treatment, to relieve promptly try inserting the hand and arm well greased down her throat and see if any of the stuff can be reached and pulled up. A stick like a bit is often tied in the mouth and the cow stood with her front feet on a ditch bank or on a box, a foot or two higher than the hind feet to allow her to belch up the gases. In severe cases the trocar is used to let the gases escape from the side. If your hand is large enough to strike an octave well on the piano, it will measure for the spot to puncture. Place the extended hand on the point of the hip bones measuring forward. Place the other hand, extended with the little finger resting on the back bone, where the thumbs touch each other is the spot to puncture the cow. The trocar has a blade and a sheath that follows the blade, the tube is left in place and the gas escapes. The ordinary man will use his pen knife and insert a turkey or other quill for a tube. After the gases have rushed out, this they do often with a whistling or noise, no further treatment is necessary. We usually dust a little iodoform over the puncture to dispel the flies. The common farmer daubs on axle grease and it seems to answer the purpose well enough.

Regurgitation.

In the majority of cases the trouble with feeding lawn clipping comes from the shortness of the feed. The cows eat of them greedily and neglect to eat the less sweet, long hay; without the long hay a proper ball or cud is not formed. A cow in grazing never secures much short feed as she has to wrap her tongue around the long grass and pull it off. A horse, on the other hand, bites the grass blades straight through and can eat the grass down to the very roots. The lawn clippings are short and are swallowed loosely matted together; they fail to cohere and when the mass is regurgitated for extra chewing the stomach fails to eject them all, enough remains in the first stomach to ferment and bring on indigestion. The cow becomes feverish often drying off in her milk.

Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

Cures.

Give her promptly a pound of Glauber or Epsom salts with two tablespoons of ground ginger. Use plenty of warm water with the salts, half a gallon to a gallon, the object being to wash or flush out the offending matter, to stop at once the fermentation of undigested foods. If the trouble ends with one dose all is well, if not, after a day repeat the dose of salts. Wait six hours after the salts operate then give the cow a quart of bran mash and a double handful of long hay, alfalfa preferred, as more tempting to her appetite. If this feed is taken readily and the cow is hungry for the next feed, give her half the amount fed to the other cows, keeping her on half ration for a couple of days.

Prevention.

It has been well said that an ounce of prevention was worth a pound of cure. Now to prevent a return of this trouble remember to see that in beginning to feed lawn clippings, begin with a small amount and be sure that the cow eats enough long hay or long grass to prevent the short grasses from packing in the stomach. Watch her to see she is chewing her cud. It is right to feed the lawn clippings as it is good food. It is fresh, green food. Grass usually runs about 75 per cent water and 10 per cent of solids or fibre. There is, therefore, a loss in drying grasses for feed by the convertion of a portion of the green succulency, that carries available nutriment into woody fibre. With corn silage to balance against alfalfa hay in California, we have a perfect ration for cows. The cheap protein of alfalfa makes it a good and economical food for milk production. One quarter of the soilds of milk are protein now to increase the milk flow by feeding protein foods we must furnish succulency as well as protein. There is a mysterious link here that I have never seen explained; that is, that if protein is not combined with succulency we lose it largely. Try feeding oil cake with corn silage and the cows gain. Feed oil cake with a dry ration and the cows do not respond in a marked degree. Remember I am speaking of well fed cows, for any underfed cow will respond to feed no matter what its character.

The Herd.

The growing heifer needs abundance of protein, so does the cow that is giving milk and dropping a calf each year. When a cow is stinted in protein she will rob her own body for the calf that is coming. Nature's great law is preservation of the species first, not for the older generation. In the lower orders of life the parents often pass away completely. An instance of this is the tick where the young eat the mother's body for their first food and incidentally carry the Texas fever to the next bunch of cattle, if they happen to have had an infected mother. In the cow, if the calf has the first of its mother's milk it can live and thrive without her. It can often do without even this small start in life from its dam, but when the human family is reached then comes that marvelous change of a completely helpless infancy.—M. E. Sherman.

He—I understand two of your sisters have joined the great majority.

She—Yes. One of them married a man named Jones and the other a man named Brown.

BABY PORK.

Baby beef is in high favor these ys with both the producer and conmer. The consumer is willing to y the extra price if the desired ality is forthcoming and all argunts in favor of baby beef are equal- applicable to baby pork. The six seven month's old hog is without ubt the moneymaker for the procer and the satisfactory article for e best class of consumers. There more money and profit in a hog ighing 150 pounds at 7 cents than a 200-pound hog at 5 cents per und or even at 7 cents per pound. is results from the universal truth at the first 10 pounds of any hog is de much cheaper than the second) pounds. Hence the 150-pound g is more profitable than the 200- und one, even at the same price per und. These facts in connection tb the higher price per pound comnded these days by the lighter hog early indicate the logical course to ırsue. In short, the evidence is all favor of quickly grown young pork, ıd seldom if ever can a farmer show est profits from hogs kept longer an six to seven months.

ARIZONA STOCK RANCH.

To grow baby pork successfully, ood pasture must be provided, the gs given a fair chance by coming in- the world strong and lusty, be kept rowing and in prime physical condion from start to finish. Bone and esh forming foods must be fed, and ombined with comfortable and clean- surroundings. Plenty of clean ater to drink at all times is importnt. A stunted pig is bad property s he never really gets over it. Good asture and care may help him but e has lost time and vigor which canot be wholly regained.

Cultivate the acquaintance of your ıogs. Let them know you as a friend. Keep back the dog and handle the ogs so they will know no fear.

FOR FLY TIME.

When the flies become thick, the ilk flow rapidly goes downward. The thoughtful dairymen try to avoid his condition, and use one of the diferent preparations on the market for his purpose. A good spray that can e made up at home is as follows:

ish oil	100 parts
il of tar	50 parts
rude carbolic acid	1 part

This formula, devised by Dr. E. L. Moore of the South Dakota Experinent Station has been found to be uite effective. It is sprayed on to the animals by means of a small hand spray pump, one application being sufficient for two days. The longer between spraying the more thoroughly tbe animals must be gone over. The odor of the preparation does not taint the milk, according to the above veterinarian, but the milk must be removed from the barn at once after milking, which should be done whether a spray is used or not.

Every dairyman knows, as a result of his own observation and experience, generally at no small expense to his bulk account, that flies mean much loss to the production of his herd. If it is impracticable or undesirable to keep the cattle in a dark stable during the day, the dairymen should use either the preparation given above or should purchase a ready made one. In either case, whatever the cost of the preparation may be, it will be more than regained in the increased amount of milk the cows will give. If the flies haven't appeared in your neighborhood yet, don't wait until they get there, but get some preparation and have it on hand so that when the first drove of flies appear you will be ready to fight them. Once the milk flow goes backward it is difficult to increase it again, so don't let the flies get a foothold.—Dairy and Produce Review.

HORNS OR NO HORNS.

That each side of the above question has its honest advocates, both in theory and practice, is an accepted fact, but that the weight of argument is very nearly equal I, for one, am not willing to concede. My observation is that cattle are constituted, in some ways, like people—a portion of them are never quite so happy as when they are taking the advantage of and prodding some other member of the great family. It seems to me the summing up of the argument in favor of the horns is almost wholly in the interests of the ones anxious to do the prodding.

I have seen, many times, innocent members of a herd injured by the borns of an ugly brute many times what it would hurt them to do away with the horns in early life. Take the young calf at about 3 weeks of age, or as soon as the horns start so you can feel them, and clip the hair so as to lay bare a spot the size of a dime. Then, with a five-cent stick of caustic potash, rolled in a piece of paper, or something to hold it by, and the end slightly moistened, rub the little horn until the outside skin peels off.

Care should be taken to make the spot large enough for a smooth job when healed, and not too large, or rubbed deep enough to make it bleed, else you will have more of a sore than is needed. By a little practice and observation, any careful person can soon learn to do it almost exactly right, and in a few years will have a herd of handsome, smooth-headed cattle, a pleasure to look at and to handle, and at least moderately quiet and comfortable with each other.—W. C. Boutwell, in Jersey Bulletin.

ALL HEALTHY COWS SHOULD BREED.

All reasonably healthy cows and heifers should be made to breed. This can be done with little trouble and slight expense if given proper attention. Many a valuable cow or heifer has been sacrificed or disposed of for the reason that she was not made to breed. This may have been due to a lack of proper information pertaining to this subject.

It is very important that a cow, in order to conceive, be in a reasonably healthy condition. The general organs should be in a conditon to perform their functional duties as nature would have them. A lack of secretion or an excess of secretion, renders conception difficult. A lack of ambiton or vigor, or an over amount of either is an unnatural condition of the genital organs. This should be overcome and controlled by the use of breeding tonic, with ingredients that will regulate and control the genital organs.

A cow before breeding should be carefully noticed to make sure there is no unnatural discharge from the vulva. A natural discharge would be a discharge of mucous that has every appearance of the white of an egg, and at the period of heat usually contains a little blood.—By Dr. David Roberts, Wisconsin State Veterinarian.

SHADE.

During summer shade should be provided. This should be rain-proof and of sufficient area to accomodate the entire herd without crowding. Of course if the hog lot is practically timbered, additional shade may not be necessary.

CREAM SEPARATORS

That's what the De Laval shops have been doing since early in February, from seven o'clock in the morning until nine o'clock at night, with every available man, and new tools being added every week; while the material supplying shops have been running double force all day and all night.

That's the record of the De Laval shops in the effort to meet the doubled demand from every section for the new Improved 1908 DE LAVAL machines.

Tbat's the showing which stands out alone and by itself, against every shop and every industry in America for 1908.

There's certainly a very good reason for it, and if you need a separator—either the first one or a good one in place of a poor one—it's up to you to find it.

The improved machine itself tells the story best—a catalogue to be had for the asking is the next best thing.

BETTER THE LOT OF THE FARMER.

President Roosevelt has appointed a commission consisting of Prof. L. H. Bailey of Cornell University, Prof. A. A. Noycs, president of the Massachusetts Institute of Technology and Gifford Pinchot, head of the Forestry Bureau of the Department of Agriculture, as a commission to study into rural conditions and to suggest ways and means of beautifying rural sections and bettering the lot of the farmer socially and intellectually.

The government has in many ways worked to develop new ideas in agriculture and to aid the farmer in solving the many knotty problems before him. It has especially given attention to the control of pests and diseases. But the movement now started will, we believe, result in making the farm and rural life in general more attractive. At least, it should do so. The unattractiveness of farm life to many has been because of the farmers' own lack of appreciating the commercial worth of beauty. A little systematic work done by a trained commission will be all that is necessary to awaken the average farmer to a knowledge which will result in the course of a few years in more atractive rural districts.

"Back to the farm" is the cry of the philanthropist in the city who sees in its congested condition a situation which is not for the good of those who are now crowding city life. But notwithstanding that it is impossible to impress that truth upon the minds of those who are laboring under these unsatisfactory conditions. Let the farmer who has the ability take the step to make these rural communities so attractive, that some of our best people, who are today repelled by the suggestion of country life, will in turn be attracted to it.

No State in the Union has possibilities of greater attractive rural life than has California. It is attractive because of financial return possibly as well as because of the possibilities of beautiful homes surrounding it.

WHITE FLY IN CHECK.

It will greatly allay the fears of citrus growers of the State to learn that reports from the White fly sections are good. The agents of the State Horticultural Commission report that few, if any, eggs or the insects are discoverable, and that the danger of its spreading has been reduced to the lowest point. The infested districts around Marysville and Oroville are being constantly patrolled by agents of the Commission and the greatest possible vigilance is being maintained for any signs of the pest. When we consider the Herculean task the Commission was facing a year ago, too much credit cannot be awarded for the effective work which it has accomplished, and the vigor with which new cases are being watched for. The proverbial needle in the hay stack was an easy problem compared with this minute fly in thousands of acres of orchard.

ASK HELP OF DEPARTMENT.

The California State Board of Trade, in conformity with the request of the California fruit growers at a meeting held recently in the board rooms, has appealed to Secretary James Wilson of the Department of Agriculture for a thorough research into the thrips pest in this State. President Arthur R. Briggs, of the Board, has written Secretary Wilson urging investigation by the Department of this pest. Mr. Briggs said:

> "This pest is considered by many as vastly more serious to the fruit interest than the pear blight, and so little progress has been made in a remedial way during the last two years that the desire for more active investigation is very generally expressed."

The matter of finding a remedy for the thrips in view of the damage it is doing throughout the State is vitally important.

NATIONAL IRRIGATION CONGRESS.

The local committee in charge of the National Irrigation Congress to be held in Albuquerque September 29th to October 3rd, is making preparation for a big and successful convention. The auditorium is capable of seating 4000 delegates. Vice-president Fairbanks has practically promised to come and the committee still has hopes that President Roosevelt will be present.

NAME THE FARM.

In a former Cutivator we suggested that it would be desirable if all who have named their ranches would write and give the name, and we would be glad to publish a list of them in our columns. A few have responded and the list will be started next week.

It will prove an interesting feature if all subscribers will join. Send in your farm name and full address of owner and we will publish.

While the present high prices of grain is causing some discouragement on the part of stock and poultry raisers, especially the latter, the fact should not be lost sight of that this State is still importing vast quantities of dairy and poultry products. This should not be, and we hope will not be much longer. Let the present condition of high prices cause deeper study into more economical methods of feeding by choosing a balanced ration and by buying feeds in largest quantities. The demand upon this coast for these products will increase every day. Let us use years like the present to build up and be prepared for the great business which is surely coming.

Another example for the benefit of co-operation is shown by the results obtained by Tustin apricot growers. They could not sell their cured fruit last fall at any satisfactory price, so they held until February of this year, when they cleaned up 15 cents per pound net to the grower.

The labor situation in Imperial valley reach
an acute stage last week when hundreds of boy
and laboring men from Los Angeles, unable
secure work were exasperated by the introductio
of gangs of Japanese and a small riot occurre
We trust the boys will control themselves in th
matter, which to them may be exasperating,
they were induced to go to Imperial under promis
of abundant work. The situation was caused
part by the cool weather holding back the ripe
ing of the fruit. It is also to be hoped that th
ranchers of Imperial will encourage the white l
borer as much as possible in these times whe
some families are short on bread and butter.

The limit to be placed upon the amount p
duced by a dairy cow, seems to be an unknow
quantity. A few years ago we thought it ha
already been reached, when five and six hundre
pounds of butter were produced in a year by on
animal. The recent test in which one cow pr
duced over 1000 pounds of butter in 12 month
and with dairymen the world over looking
the animal which will beat that record, leads u
to inquire where is the limit. It also leads
to inquire where the average cow with its 130
140 pounds stands. We think it should stand
the shambles, and the cow with the higher p
ductive powers put in her place.

Messrs. Wm. Rieth and H. Wupperman of D
dorf in the Rhine district of Germany, are
California investigating agricultural conditio
Mr. Rieth is getting information more parti
larly as to fruit conditions and methods of cultur
while Mr. Wupperman is giving more attention
the American plan of handling thoroughbred po
try. In this respect he says that the Germ
poultryman is not so far advanced as the Ame
can, as the keeping of thoroughbreds is much l
general among the producing classes than in t
country.

The announcement that the Bureau of Anim
Industry has made a discovery by which vacci
may be administered to hogs which makes th
immune to hog cholera, will cause much satisf
tion on the part of swine raisers the coun
over. It is reported that the process consists
the injection of the blood of a sick animal i
the veins of a well one plus the blood or ser
of an immune animal. The vaccine is produc
by infected blood instead of artificial cultur

Notwithstanding the complaint all over t
State regarding the scant rainfall this year, t
crops are referred to as all the way from "f
condition" to a "bumper crop." This, we thin
is true, unless with the possible exception
prunes, which some claim will not exceed 10 p
cent of a full crop. Even the hay crop, whi
at one time was thought to be a total failure,
coming in with better returns than anticipat
a month ago.

The reappointment of Mr. David Lubin to
former position on the International Institute
Agriculture at Rome, has been received wi
hearty commendation by his many friends in t
State. While all do not receive Mr. Lubin's id
with unqualified approval, yet the belief is g
eral that he is honest in his endeavor to advan
the welfare of the agriculturist and apprecia
the opportunity which permits him to work
his theories.

California fruit growers are looking sidew
at the various proposals of tariff revision. T
suggestion is already made that each commun
should begin to organize to protect the inter
of its principal industry. The California Pro
tion Comittee has called a meeting in San Fr
cisco, July 16th. It is urged that all secti
send representatives.

A great lesson has been taught along the lin
advertising this year by the action of the Fr
Growers' Exchange advertising its oranges in t
markets of Iowa. The results have been so sa
factory that probably a more extended advertisi
campaign will be taken up next year.

So marvelous have been the developments i
the Imperial valley within the past 15 mont
that recent visitors state "all descriptions f
far short of the realty."

This may prove a good year to put in practi
some dry farming operations.

Agricultural Notes of the Pacific Coast

Northern California

olo grain is heavy.

anta Rosa prunes will be a fairly vy crop.

olo county is claiming to be quite itrus section.

ennett valley farmers are busy huring vines.

he Ukiah cannery has an order for 00 cases of tomatoes.

legal warfare is on between two fruit buyers at Woodland.

p to the end of May Vacaville ped 40 cars of green fruit.

erries about Gridley are reported oing exceptionaly well this year.

ie first full car of green fruit out Vinters was about the 1st of June.

uir peaches are reported exception- heavy crop in the orchards about ff.

rigation of beet fields has been ted in all districts about Hamil- City.

mp hay recently set fire to a barn Dixon through spontaneous com- on.

y spring has caused a shortage of oes from the lower Sacramento y section.

nployees of the cannery at Grid- ield their fourteenth annual can- picnic last week.

asta county strawberries have ied their season and logan ber- are now bearing heavily.

ndocino county has 308 acres of which are lying idle this season, over 1400 acres under cultivation.

rham, Butte county, will have an nse crop of wheat and many and tons of hay are being baled.

e reports continue to affirm that ots in the northern part of the will give heaviest crop in its his-

p growers at Biggs have perfect- machine for picking hops which laimed will revolutionize the hop try.

mers at Sebastopol have form- free market association to avail selves of the free market in San isco.

erious plague of grasshoppers has ed the Fall River valley. Crops have been planted, were com- y wiped.

government is advertising for or the Orland Irrigation project. olves the placing of about 13,500 yards of concrete.

ah vegetables and berries are do- ell and yielding large crops this n. Hay and grain are both prov- uch larger crops than anticipat- rlier.

erson finds that her crop of es, plums, pears and apricots ot be reduced by late frosts as as anticipated. The prunes will ceptionally light.

proposed Iron Canyon dam in na county, if constructed, will te about 3,000,000 acres of land Sacramento valley. It will store a 250,000 acre feet.

ysville owners of orange trees, were cut back to defoliate dur- e White fly campaign, are now supplied with navel buds to be ed in the young suckers which sprung up from the defoliated

Central California

Tulare has a new creamery just beginning operations.

It is now thought that $60 per ton will be the starting price on the coming crop of raisins.

California will make $15,000,000 worth of hay this season.

The total hay crop of the State this year will be worth $15,000,000.

June fiesta held at Modesto last week was a scene of great beauty.

Cash for the delivery of fruit is offered by fruit drying firms at Hanford.

Board of Directors of Tulare irrigation district is prospecting for new water supply.

Commissioner Sharp of Kings county is urging a strong fight against Johnson grass.

Stakes set by a band of surveyors wrecked a harvester near Salinas county recently.

It is estimated that there are 16,000 tons of holdover raisins in the San Joaquin valley.

Crops over the San Joaquin valley are vastly better than anticipated earlier in the season.

Lindsay wishes the addition of many outside acres of orange groves to the incorporate limits of the city.

At the annual meeting of the Pajaro valley Board of Trade it was urged that an apple festival be held this fall.

Indications point to great developments in new irrigation system in Stanislaus and San Joaquin counties.

Last year's shipment of apples from Watsonville including those evaporated and converted into vinegar, was 2058.

Hunting tags to the extent of 115,000 were issued to this State last year. The law has proven a remarkable success.

The Tulare County Times predicts that the grain crop of Tulare county will be a surprise to many who have anticipated only complete failure.

An abundant supply of hay presses is on the ranches of San Benito valley. Early in the season the price of $1.60 per ton was demanded, but baling is now done at $1.35.

Fruit dryers of Hanford are contemplating the changing of the fruit cutting schedule. Instead of cutting by the box, the standard this year will be per hundred pounds.

At the regular meeting of the Kings County Fruit Association recently held at Hanford, it was urged that the common schools give more attention to the teaching of agriculture.

State game and fish warden has filed complaint against the gas company of Santa Cruz to prevent the discharge of tar and other poisonous substances which destroy the fish in the river.

Apple growers at Watsonville are in favor of a proposed law in the National Congress controlling the packing of apples, size of package, etc., of all apples exported or shipped from State to State.

A break in the wier of the Kings river near the northeast corner of Kings county, has caused a suspicion that it was done by the explosion of dynamite in order to secure the use of the water on other lands.

Southern California

Tomato shipping is in full swing at Brawley.

Yucaipe cherries are now coming into market.

Calexico proposes to become noted for its tree-lined streets.

Apricots will be later this season owing to the cool weather.

Southern California output of walnuts this year will be about 9000 tons.

Cuttings of black figs planted at Indio this spring are already producing fruit.

The Perris, Allesandro and San Jacinto grain districts are promising a very fair crop.

Apricots at Santa Susana will be a full crop and the fruit promises to be of good quality.

The lima bean acreage will be the biggest this year in the history of Ventura county.

The first full carload of cantaloupes out of Imperial valley was sent from Brawley May 31st.

El Modena gardeners are shipping large quantities of beans and berries to the Los Angeles market.

A grower in Imperial valley is experimenting with a new variety of cantaloupes called the "French Melon."

The price of onions has been rather disappointing this season, but better prices are promised in the near future.

It is now figured that the total output of cantaloupes from the Coachella and Imperial valleys will be somewhat less than 1900 cars.

San Diego takes much satisfaction and profit from the establishing of a lemon juice factory which cans, or bottles, lemon juice.

The San Bernardino and San Gabriel forest reserves have been consolidated and will hereafter be known as the San Gabriel reserve.

Los Angeles County Mutual Fire Association is now carrying about $4,000,000 of fire insurance on the farm buildings of that place.

United States and Mexico have combined in the appointment of a commission to study the divison of the waters of the Colorado rver.

Melon shippers in Imperial valley are given a better express service than in the past. The vines this year are not covered with aphis as last year.

Coachella valley has been making a record on onions this year, one acre having produced over 1000 crates of onions, and one field of 45 acres averaging 600 crates per acre.

The cool weather has seriously retarded the ripening of cantaloupes and hundreds of men and boys who have flocked to the Imperial valley are left without sufficient to keep them employed.

Members of the Woodmen of America in the orange sections of the State are shipping quantities of oranges to Peoria, Illinois, to be given to members of the Grand Camp of Woodmen.

Deciduous fruit growers at Hemet have organized and eelcted the following directors: J.M. Frazier, J. C. Belton, L. L. Newton, W. S. Mudd, William Bruce, Alva Van Winkle and J. A. Nelson.

The Coast

A Wennatchee farmer will ship his coming crop to Australia.

Walla Walla asparagus crop is proving a complete failure this season.

Mexico will produce during the present year approximately 115,00 tons of sugar.

Up to the first of this month strawberries sold in Seattle as high as $5.50 per crate.

Montana is to devote a large tract of land to breeding the American bison or buffalo.

Sheep men of Central Idaho are being driven from the ranges there by lack of pasture.

Washington is shipping heavily of wheat and other grains to supply California demand.

Stock yards of Spokane are to be given a $200,000 packing plant within the coming year.

Yuma has begun shipping melons, and is now sending out some exceptionally fine stock.

The State College at Washington will dispose of a large tract of land now belonging to the college.

A new wool baler and storehouse for storing wool has just been completed at Baker City, Oregon.

May proved to be the busiest May ever in the reecipt of grain at Tacoma. The total was 1135 cars.

The coming Oregon hop yield is estimated at about 100,000 bales, which will be at least 40,000 less than last year.

It is rumored that President Roosevelt will attend the irrigation congress to be held at Albuquerque next September.

Exports of grain from Portland for the month of May, 1908, show a material increase over those of the previous years.

Salt River valley farmers in Arizona are experimenting with asparagus and anticipating the early establishing of a cannery.

Oregon apple growers are somewhat disappointed over the spring sales of cold storage stock. The holdover in the East was much larger than anticipated.

Tests made on the new irrigation system recently installed at Hanford, Washington, which is said to be the largest in the world, proved entirely satisfactory.

Experiments at the Washington State College at Pullman have gone to prove that dust spraying for many insects pests, has met with only indifferent success.

The wheat crop at Horse Heaven, Washington, thought at first to be seriously injured by high winds, is now pronounced to be safe and good for a fair crop.

The grain exports from the Pacific Northwest for the 11 months ending May 31st, were nearly 44,000,000 bushels, or nearly 13,000,000 more bushels than for '06 and '07.

A claim is made that the pumping plant recently erected by the Hanford Irrigation Company, Priest Rapids, Washington, is the largest yet eercted in the world. It has cost over $500,000 and wil pump water to irrigate over 35,000 acres.

Coulson's Cresolene

Coulson's CRESOLENE LICE KILLER AND DISINFECTANT KILLS DESTROYS CURES Coulson Poultry & Stock Food Co.

**LICE KILLER
DISINFECTANT
AND DIP**

Dilute With Water Before Using

CRESOLENE is a powerful disinfectant, insecticide, and germicide obtained from coal tar. It is non-poisonous, and non-corrosive and will do no harm to the most delicate skin.

It mixes readily with water, forming a milky emulsion, and can be diluted from 50 to 100 times it own bulk, in accordance with the different uses to which it is put.

Thus when you purchase 1 gallon of CRESOLENE you can make up to 100 gallons of the best disinfectant for use with stock, poultry, dogs or as a general disinfectant and insecticide.

This reduces the cost to 1 1-4 cents per gallon which is cheaper than anything else on the market.

PRICES: Quart can, 50c; one-half gallon, 85c; gallon, $1.25.
Freight paid on orders of one gallon or more.

Profit in the Poultry Yar

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed management, disease and its prevention will be answered through these colu

POULTRY FOODS AND FEEDING.

THE present price of grain and mill products and the prospect that they will not be any lower in the near future, will force the poultry people during the coming year to give careful attention to what and how they feed, in order that the balance may not be on the wrong side of the ledger.

A knowledge of the elements of the science of feeding and an application of the same, enables the feeder to get more out of a dollar expended for food than he otherwise would. It is a well established principle, that to keep an animal in a healthy, vigorous condition the food must supply certain compounds. These are known to the chemist as protein, carbohydrates and fats. The protein is rich in nitrogen and is abundant in lean meat, dried blood, bran, alfalfa, etc. While the carbohydrates are represented by starches and sugars, and make up a large per cent of such foods as barley, potatoes and corn. Corn runs high in fat.

Another principle well established in feeding is that a somewhat definite relation should exist between the relative amount of protein, carbohydrate and fats used, i.e., in feeding a pound of protein it should be combined with a certain number of pounds of carbohydrates and fats. This relation is known as a nutritive ratio. In getting this relation the quantity of fat used is multiplied by two and one-fourth and added to the carbohydrates, as a pound of fat is considered equivalent to two and one-fourth pounds of starchy material in doing the work of the body.

Prof. Wheeler of the New York Station believes the best results follow when four and one-half to five pounds of starchy material and fat is combined with one pound of protein.

Amount of Food Required.

Experience shows that 100 laying Leghorns will eat from 18 to 20 pounds of dry food daily, and it should contain two and one-half to three pounds of protein, one-half to one pound of fat and 10 to 11½ pounds of carbohydrates. If these hens are fed 20 pounds of wheat, it would contain of digestible material the following quantities: Protein, 1.84 pounds; carbohydrates, 12.2 pounds and fat 0.24 pounds, and the nutritive ratio would be 1-6.9 much too wide for best result. No single grain will supply a well balanced ration. In the 20 pounds of wheat we havo a sufficient quantity of starchy material, but tho ration is low in protein and fat. It is impossible to feed any ono grain and satisfy the needs of the body in the way of a well balanced ration. It is only by combining several substances that we can get satisfactory results. To illustrate:

A Balanced Ration.

			Pounds Digestible Material		
			Protein	Carboh's	Fat
7	lbs.	wheat contain	0.64	4.27	0.08
2	"	alfalfa hay	0.27	0.74	0.03
2	"	wheat bran	0.22	0.84	0.05
2	"	middlings	0.24	1.07	0.08
5	"	rolled barley	0.47	2.98	0.11
1	"	linseed oil cake	0.26	0.38	0.07
¾	"	blood meal	0.54	0.045	0.075
19¾	"		2.64	10.325	.495

In the above we have 19¾ pounds of a mixture that contains sufficient quantities of the various nutrie the right proportion to meet the n of a hundred Leghorns for on d

for Chickens.

w potatoes fed to chickens eir laying qualities, and you consider the best way nall potatoes? Have a good ich I can't put to any other . S., Long Beach.

t is not probable that the raw potatoes will interfere aying qualities of your hens. ne time I do not consider it method of feeding them.

y as good a way as any to oes, is to boil them and h bran, using bran enough the mixture somewhat n character. The potatoes de the necessary starchy while the bran is rich in lfalfa meal could be used ial substitute for the bran, sometimes found it neces-egin the feeding of this in ntities, as hens do not al-to it readily.—S. S. T.

OTHERLY ROOSTER.

a banty rooster which we aking a record for having motherly instincts. We taking the nest and acting as any old hen could. After veek we gave him six eggs s faithful in his work until the chicks. He is now his little flock and feeds rfection. He has attracted ation in our neighborhood, come to see him calling his s.—Mrs. J. J. A., Uplands.

POULTRY HINTS.

My poultry experience may be of some value to subscribers of the Cultivator. I have 40 hens with which I have three males. I recently set 194 eggs of which 97 were in an incubator and the remainder under the hen. At the first test I only had one infertile egg and the second time I had five. From these I hatched 157 chicks which are now two weeks old and all living.

A little experience I had last fall may be of value so I give it for what it is worth. Many of my young chicks were badly affected in their eyes. Some were even entirely blind so that when I had to feed them I dropped one drop of spirits of camphor in each eye morning and evening and all were soon entirely cured of their affliction.

At another time several had black spots on their combs. I secured 5 cents worth of Red Precipitate, and of this I used a little about the size of a pea thoroughly mixed with a spoonful of lard and five drops of carbolic acid. I touched the black spots with this mixture and they soon disappeared and I now have no sick chicks.

Cleanliness.

I believe in absolute cleanliness of my coops and sweep them each week with a brush, then oil all crevices and the nests. For setting hens I change boxes once during the three weeks, always thoroughly oiling the clean box before putting it in.

Of course I keep good, fresh water at all times, for which I use granite pans. I have spaded a dust ditch which I occasionally dampen at evening with the hose. This makes the dirt very agreeable to the hens to wallow in the next day.

No Lice.

I have no trouble with lice or mites but I do not miss a week without giving them attention. I watch carefully for I do not like sick chicks. If one looks sick I give a pill, which I make as follows: 1 tablespoon flour; ½ teaspoon red pepper; 1 teaspoon lard ½ teaspoon camphor; ½ teaspoon Harlemensis oil; 1 teaspoon coal oil.

Mix these ingredients and make a pill about the size of a pencil and nearly one inch long tapered at one end. Give twice a day. Open the mouth and put small end first and there will be no trouble.

By following these lines I have had good "luck," although I have been in California only 18 months, but I could not get along without the Cultivator, for in it I find so many useful things. —Mrs. Ella Enos, Long Beach.

SURE OF FRESH EGGS.

There is a German dairyman and farmer whose place is not far from Philadelphia who greatly plumes himself upon the absolute superiority of his products above all others in the vicinity.

On one occasion he personally applied to a Germantown housekeeper for a transfer of her custom to himself. "I hears dot you half a lot of drouble mit dot dairyman of yours," he said. "Yust you gif me your custom und dere vill be no drouble!"

"Are your eggs always fresh?" asked the woman.

"Fresh" repeated the German, in an indignant tone. "Let me dell you, madam, dot my hens, nefer lay anything but fresh eggs!"—Harper's Weekly.

A good collection of stock is expected at the State Farm at Davis by October 1st.

CLYDE J. MOSS **Corona, Cal.**

Farmers of Idaho have gone into politics and are demanding the appointment of a railway commission through which they may receive redress from many transportation abuses which now prevail.

A Santa Cruz nurseryman has purchased a carload of calla lily bulbs, which he will use in reproducing for supplying bulbs for the Eastern markets. He now has 700,00 bulbs on hand.

A SUCCULENT DAIRY FOOD.

The advantage of having variety in the food of the dairy cow is more important than many dairymen appreciate. The increase in the flow of milk when a cow is taken from the continuously dry feed and put upon one of greater variety, especially if it contains roots or silage, is often remarked when such change is made. Farmers in California often have the idea that with summer all the year round. there is no necessity for providing silage, and this feeling has been so general that the building of silos is far less general than it should be. The enthusiasm of the dairyman who has begun to use silage after being without it for years is proverbial, and yet the increase in number is still too low.

While many admit that silage for cows has no equal in economy of production and in inducing increased flow of milk, the cost of building the silo, or else the failure to understand the manner of handling tne silage has been such a bugbear as to compel many who really wish to have this desirable adjunct to the dairy to refrain from adding it until a more convenient day. Mrs. Sherman has often given in these columns articles touching upon the cost and manner of construction of silos, also as to method of cutting and storing, yet there often come questions to the office requesting information regarding this valuable food.

Now comes a valuable little "Book on Silage" by F. W. Woll, and published by the Silver Mfg. Co., Salem, Ohio. It is as full of information on silo and its production as an egg of meat. For instance as to the size of silos it says: "Corn silage will weigh from 30 pounds or less to toward 50 pounds per cubic foot, according to the depth of the silo and the amount of moisture contained in the silo. We may take 40 pounds as the average weight per cubic foot of silage. One ton will accordingly take up 50 cubic feet and 100 tons 5000 cubic feet." From this one may readily figure the size of the silo wanted, bearing in mind that, as a rule, it will not be well to feed over 40 pounds of silage per day. Under Eastern conditions 180 days is given as the average silage feeding season. In California this will vary from almost the entire year down to a few months according to local conditions.

One of California's successful farmers who has become a thorough believer in silage as the most economic feed for dairy cows is Mr. Geo. L. Perham of Baden, San Mateo county. A view of his silos and the work of filling appears on this page. He has been very successful in the choice of his cutter and appliances for filling. These were purchased of the Pacific Implement Company of San Francisco, and regarding them Mr. Perham says:

A SAN MATEO COUNTY SILO.

"Last fall I purchased of your firm a No. 12 'Ohio' ensilage cutter with blower and self-feed table, and after using it for cutting corn, barley and oats—using eelctric power—I am ready to say that its efficiency has delighted me, and I think it is an 'all right' machine. The ease of feeding the uniform quality of the cut feed and the capacity are noticeable features. The photograph which I am sending under separate cover shows the machine at work filling one of the two silos on my dairy and poultry farm here. Give the machine sharp knives and the requisite power and it will do the rest."

Corn is the usually preferred crop for the manufacture of silage, and it is not yet too late to plant for this season. Mrs. Sherman has given in her department many good points on the planting and growth of corn. If planted soon the building of silo may then be taken up more at the convenience of the dairyman and by the time the crop is ready for the cutter the machinery and silo may be constructed and put in place.

Silage is an economical food; it increases the milk flow; it is relished by the cow. It is a money maker.

Conserve for the Peop

THE CULTIVATOR has nothing to do with the dispute between the City of Los Angeles and Congressman Smith and others, and many producers in Inyo county, regarding the rights of the city to waters of the Owens river, but there is a principle involved as to the duties of the Forestry Service which we believe makes the following statement by Forester Pinchot educational and at the same time especially valuable.

* * *

Mr. Smith makes two points: First, that the Forest Service in issuing permits for rights of way to water appropriators under the State laws, shows favoritism by preferring a later to an earlier appropriator, or at least claims that it may do so; second, that the Forest Service charges for permits issued to hydro-electric power companies.

The Forest Service has never preferred one citizen or private corporation to another nor has it ever claimed that it had the power to do so. On the contrary, it has declined to inquire into the water rights of contesting applicants further than to require each to show a prima facie water right in accordance with the State laws. If both show such a right the service has refused to inquire as to which of the two has the better right, but has issued permits to both, leaving them to settle all questions of water right in the State courts.

The thing the service has done to which Mr. Smith objects is to prefer a municipality seeking a right of way for a municipal water supply to private citizens and corporations seeking rights of way for personal gain, regarding the use of water by a city for a municipal supply as in a peculiar sense a public use. I, therefore, did what I could to aid the city of Los Angeles in securing the right of way for its aqueduct, which was finally granted it by act of congress, and have recommended, for the protection of the aqueduct from pollution, the inclusion within the Sierra National forest of lands in the valley of the Owens river. This inclusion Mr. Smith strongly opposed. Futhermore, in the exercise of any discretion conferred upon me by law, I shall always prefer the interests of a city or other municipal corporation to those of an individual if the claims of the two are in other respects equal. National forests are reserved and administered primarily for the benefit of the public and only seconarily as an opportunity for money-making by forest users. I am strongly of the opinion that a city, county or other municipal corporation has a higher standing as a representative of the public than any corporation organized for the purpose of money making.

You do not refer to the charge imposed by the Forest Service upon commercial power companies to which Mr. Smith objects. I believe that the permits issued to these companies by the Forest Service are of great value and that the permittees should pay for them as do others who get the exclusive use of national forest lands and resources for commercial profit. If lumbermen must pay for timber, stockmen for grazing permits, hotel keepers for hotel permits, and the like, many of these being men of small means, I can not understand why power companies, most of which are wealthy and powerful corporations should not pay a fair price for they get also. I believe further the president was entirely right he said in his message of Feb 26:

"The material wealth and na resources of the country relate waterways are being steadily sorbed by great monopolies.

"Among these monopolies, a report of the commission point there is no other which threat has ever threatened, such intol interference with the daily life people as the consolidation of panies controlling water power. your special attention to the a of the power corporations, th bills introduced at the present se to escape from the possibility o ernment regulation in the intere the people. These bills are in to enable the corporations t possession in perpetuity of n forest lands for the purposes of business, where and as they wholly without compensation public. Yet the effect of gr such privileges, taken togeth rights already acquired under laws, would be to give away pro of enormous value. Through foresight we have formed the granting without compensat tremely valuable rights amoun monopolies on navigable stre on the public domain. The chase at great expense of wat thus carelessly given away return has already begun in and before long will be nec the West also. No rights water power should be grant corporations in perpetuity, b for a length of time sufficie low them to conduct their profitably. A reasonable should, of course, be made f able rights and privileges whi obtain from the national gov The values for which this c made will untimately, throu natural growth and orderly ment of our population and in reach enormous amounts. share of the increase should guarded for the benefit of the from whose labor it springs. T ceeds thus secured, after the administration and improvem been met, should naturally ed to the development of o waterways."

I believe that it is entirel for the Forest Service to insert able conditions in its powe to prevent monoply. One conditions is that the perm commence construction with cified and complete within specified time which may b only on account of unfor neering obstacles and the is for the purpose of pre permittee from holding wa privileges unused. He mu develop them for the ben public or forfeit his permit

Mr. Smith is mistaken in that I favor a mere revoc for power plants. It is con did that. The act of Febr 1901, (31 Stat. 790) forbid of any other permit than a one. The language of the follows:

"That any permission give Secretary of the Interior provisions of this act may b by him or his successor in tion, and shall not be held any right or easement or to or over any public lan tion or park."

Instead of favoring this

/e advocated legislation which will horize the issue of power permits evocable for a fixed term, except breach of condition. At the re- ıst of the forest service, a clause s inserted in the agricultural ap- priation bill now pending, which ıld have granted this authority. It s stricken out by the house of rep- entatives upon a point of order.

a February and March, a series of ferences were held between repre- tatives of the government and rep- entatives of many large power ıpanies for the purpose of agree- upon legislation on this subject, the demands of the power com- ies were considered by the govern- ıt to be so extreme that no agree- ıt was reached. If the power com- ies are now suffering because their nits are revocable, they have only nselves to blame for that condi- The one obstacle to legislation ıorizing irrevocable permits for a d term was their own opposition t unless other concessions, which president has declared unreason- in the message I have quoted ve, were granted to them at the e time.

r. Smith says that "there is, of se, no objection to charging power panies a fair price for the land use for reservoirs and rights of ." That is precisely the thing, the only thing; the forest service oing. The charge it imposes is for the use of land, not a tax im- d by a sovereign. The value of land for power purposes is meas- by the amount of power actually loped each year, and the charge ixed accordingly. Any private owner having a power site on his would refuse to rent it for its e considered as a wood lot, but d insist on its power value as the of the annual rent. If his prop- were to be taken from him for r purposes by condemnation he d be entitled to its value for such oses. This is clearly stated in case of Boom Co. vs. Patterson, rted in Volume 98 of the U. S. Su- e Court Reports at page 403. In case certain islands in the upper issippi river were taken by con- ıation for a log boom. For any purpose they were worth $300, or boom purposes their value was at $5500, and judgment was for that amount. This judg- , the Supreme Court of the d States affirmed, saying:

determining the value of land opriated for public purposes, the considerations are to be regard- in a sale of property between te parties. The inquiry in such must be what is the property in the market, viewed not mere- th reference to the uses to it is at the time applied, but reference to the uses to which it ainly adapted; that is to say, is it worth from its availability aluable uses. Property is not to emed worthless because the own- lows it to go to waste, or to be ded as valueless because he is le to put it to any use. Others be able to use it, and make it rve the necessities or conven- s of life. Its capability of being thus available gives it a market which can be readily estimated."

ls effectually disposes of the ar- nt of the power companies that could take these power sites the payment of a nominal ;e per acre if the land were sub- to condemnation under the State They certainly could not do so unless the condemnation jury were ignorant of the power value of the land or unmindful of their oaths to do justice.

Congress has declared by the act of 1901, above cited, that the United States shall not alienate its lands permanently for power purposes. The price that the Forest Service charges for renting them for such purposes is not only a fair price, but a very low one. This is shown by the facts that many permits have been taken out subject to the charge; that a much higher initial charge is imposed by the Canadian government upon power plants at Niagara Falls; that at conferences held in Washington late in February and early in March of this year between representatives of the government on the one hand, and of the more important power companies and of banking houses interested in financing power projects on the other, the representatives of the government suggested that the power companies should submit their business to an investigation by the bureau of incorporations for determination of the question whether or not the rate of charge was unreasonable, and no response was ever made to this suggestion; that the charge imposed upon the Edison Electric Company is, by the special statute under which that company is occupying lands in the national forests, required to be "reasonable" and the company has paid the charge for this and the preceding fiscal year, although if it were in fact confiscatory the company would not have been obliged to pay and could have had recourse to the courts for relief; and finally, that careful inquiries made by the forest service as to the value of power sites and the profits of power companies show that the charge is so small that it cannot possibly be any check upon development.

With reference to Mr. Smith's suggestion that the revocation of a permit would inflict hardship on power companies: It is obvious that the power of the government to revoke a permit for breach of condition would compel the permittee to fulfill the conditions. He could not afford to do otherwise, and if he did, and the permit were revoked, a similar permit could be given to any other person or corporation, and the right would be sufficiently valuable to make it certain that there would be no lack of applicants for the permit. There is no danger whatever that the generation of electric power would stop and consumers be thus left without any supply. It is quite possible that a court, for the protection of the power consumers might appoint a reeciver to take charge of the power plant and conduct it in accordance with law and the conditions of the permit, or take proper action to compel the fulfillment of those conditions to insure the service of the public for which the corporation was organized and the permit issued.

The Northwestern Pacific Railroad, the picturesque route of California, traversing Marin, Sonoma, Mendocino, Lake and Humboldt counties, has ready for distribution, "Vacation, 1908," giving full information in regard to camping spots, mineral springs, resorts and country homes and farms to suit every purse and taste. This book can be obtained by applying at Southern Pacific and Santa Fe ticket office, Los Angeles, Cal.

Run Down Orchard.

I bought a ten-acre apricot grove two months ago. The trees are ten years old and have a light crop. The orchard has not been plowed nor irrigated nor pruned in five years. Some of the trees are dead and some are half dead, but seven-eighths of the trees are in fair shape considering the bad care they have had. I am installing a pumping plant to irrigate those trees. What affect will the water have on them? Will it help the fruit at this time or will it hurt them? Will it be wise to plow now? When is the proper time to irrigate and also the proper time to prune? What is the best fertilizer for apricots? When is the best time to set out young peach and plum trees? I have quite a number of those in my apricot orchard; they run hit and miss and are in the way, but they are loaded with young fruit. I have lots of room to transplant them; please to advise. I have fine fruit and vegetable land and would like to know if it is early enough to plant field corn now and what is the best kind to plant. When is the best time to plant the fall crop of potatoes and what is the best kind to plant? Is it necessary to use any fertilizer? If so, what kind shall I use and how? My land is a heavy loam and is in fair order.—W. E. G., Anaheim.

Irrigation at this time will have but little benefit for the apricots now ripening, but would put the trees in condition to bear better crop next year. If you do not irrigate at once, do so as soon as fruit is off. That will give vigor to the tree and thus form more fruit buds for next year. After irrigating, disk or cultivate thoroughly. If you wish to stimulate bud growth and a bigger crop next year prune after this year's fruit is off. To stimulate stronger wood growth, which perhaps you need, prune when trees are dormant. Stable manure is best. If you can't afford enough of that, supplement with commercial fertilizer.

Plant young peaches and plums when dormant—December to February. The ones you speak of are probably not worth the planting. It costs too much to pump water and care for an orchard to start in with any other than first class young trees. For that reason it may be a question as to the bulk of your apricot orchard being worth cultivating after five years of neglect. You will probably be richer to dig out and start in with new, vigorous trees.

You can plant corn now, but do it soon. If for sweet corn, plant Oregon Evergreen or Stowells' Evergreen. If for ordinary field corn, Reid's Yellow Dent or White Cap Yellow Dent are good.

Plant all potatoes during July. Early Rose or Burbanks are good varieties though your neighbors will be your best authorities as to best variety for your section. Necessity for use of fertilizer depends on condition of soil. For potatoes it will probably be wise to apply fertilizer rich in potash.

Planting Dewberries.

Please inform me when and how far apart to plant dewberries. How and when should they be pruned?—J. B., Alpaugh.

Plant from January 1st to March 1st. Plant in rows five feet apart and about two feet apart in the row. Water and cultivate well and when any cane reaches 15 inches in length nip it off the end and when the laterals are thrown out clip them back to 10 or 12 inches. Allow not more than five or six of the strongest canes to grow and thin out the weaker ones. By going over them every two or three weeks throughout the summer this pruning can be easily and rapidly done and by the close of the season you will have stocky, well ripened bushes with large bearing capacity with no expense of trellising. The following season it will be necessary to cut back the strong shoots that come up from the crown very much as you did the first season.

As soon as the crop is off cut out the old wood that has borne the crop and treat the new growth just as you did the first year. The Lucretia, if you get it true, is the best variety and in California worth all other varieties combined. It is unsurpassed for flavor in canning, being superior to any known variety of blackberry.—Q. A. L.

Toads.

Will you please tell me how to get rid of toads. They croak so I can't sleep good. There are some in the turnips and some in the water tanks.—T. H. K., West Saticoy.

Don't get rid of toads. They are too valuable in garden and ranch. Rather cultivate them. Probably you mean frogs. They are lusty singers. How to get rid of them we cannot say unless you drain all pools where they congregate.

Charges for Recipes.

C. F. R. of Hemet asks the Cultivator to tell him whether he can lawfully sell recipes which he has discovered, one to cure chickens of roup; one to break setting hens and make them lay in three to six days; and one, a splendid remedy for piles. There is nothing to prevent him from advertising and charging for the same, and if he will send us his full name we will give him, by letter, the further information he desires.

Tomatoes Dropping.

Will you kindly state in your paper the reason for tomatoes dropping blossoms with short piece of stem attached? There seems to be a joint in the stem which breaks off.—J. V. B., Ripon.

Cold weather is probably the reason. We will ask Mr. Lobinger to prescribe remedy if there is any.

Drying Fruit.

Please give information for drying peaches and pears as practiced in California?—H. B., Chiles, Cal.

It's a long subject. Will try and give some information next week.

Unprofitable Nectarines.

I am a reader of your paper and find many valuable articles from week to week of a helpful nature, especially to the small rancher. In this connection I wish to say that I have among my trees two white nectarines which have never borne any fruit. They are rank and healthy growers and bloom profusely, but never seem to reach fruit age. In fact, I think the bloom all falls off. Is there any remedy except to replant with other trees?—W. G. S., Pomona.

You, no doubt, have the Victoria nectarine, which is noted for being a shy bearer in your vicinity. Lord Napier is another. You can convert your trees into Stanwick or Downton, either of which will bear to suit you I am sure. They are red and not quite so fine in quality as the two first named, but they are good. good way to do is to cut off the and bud into the sprouts. If you not want to keep them as nectarin bud them to peaches or apric plums or any stone fruit. It wo be folly to cut them out if they strong and healthy.—J. W. M.

Destroying Rabbits.

Please explain Pasteur's metho destroying rabbits. Can anyone ply the method? What expense i tached to the method and how —W. O. S., Coachella.

We do not know, but think it the same as inoculating rats is done by mixing the virus food and left where rats will e We think you may secure informa by writing the Pasteur Vaccine San Francisco or Chicago.

Soil Analysis.

I would like to make some an ses for determining the amount o kali in the soil here. The lan spotted and it would be impo to send away enough samples to an accurate estimate. I wish to

ewash.

ll you kindly send me a recipe mixing whitewash for buildings, will not crack and peel off?—J. F., Watsonville.

e addition of a handful of salt, dissolved, to a bucket of white- will make it stick. There are complicated formulas, but this ective for rough buildings.

JARRAH WILL NOT GROW.

your issue of May 21st I note inquiry with regard to the euca- ıs Marginata or Jarrah. For t seven or eight years I have experimenting on a small scale this tree. Having read of its y excellent qualities I procured and after considerable difficulty eeded in getting about fifty plants enough to set out. These all during the summer although bet- ared for than several other varie- of eucalyptus that did very well. same season.

e next year I tried again with no r success. I then determined to ast raise one or two specimen if nothing more, but although I had fairly good success with t fifty varieties of eucalyptus, the inata has proven too much for me ıis climate. I have managed to them to grow very well in my house where the atmosphere l be kept warm and moist, and been able to keep them alive for ıg time in my lath house, but in- ıbly when put out in the open have died within a year or two at no time have they made more a very indifferent growth under most favorable conditions I could them.

y land is situated about 20 miles the coast at an altitude of about feet. Winters are warm enough raise Citriodora Lehmanni and r tender varieties of eucalyptus. I well protected from the desert ls by a range of hills so that it ld seem as if my place was much e favorably situated than most hes in California for such experi- ts, but it is evident that the Jar- will grow only in locations having mer, moister atmosphere than any- g around here. I should like to from any one who has made a ess of this tree if it has grown in fornia.—J. H. Dodson, Forest Nur- , El Cajon.

'une growers at San Jose who over their crop of prunes are rebelling at the injustice of the collector listing such prunes for tion after the grower has paid his s on farm and on the trees.

STATE FAIR PREMIUM LISTS.

The California State Agricultural Society has issued the premium list for its fifty-fifth annual exposition, which will be held at Sacramento, August 29th to September 5, 1908. The book has over 100 pages of information regarding regular and special premiums. A great fair is planned for this fall. Copies may be had of J. A. Filcher, secretary, Sacramento.

* * *

We also have the premium list of the First Annual Colorado Inter-state Fair and Exposition to be held in Denver September 7-12, 1908.

This association is spending $150,000 for buildings and improvement this year and promises a great showing of products of Colorado. G. C. Fuller, secretary, Denver, will mail lists to interested parties.

HOLSTEIN-FRESIAN ANNUAL MEETING.

The annual meeting of the Holstein-Fresian Association of America was held at Syracuse, N. Y., June 3, 1908. Hon. O. U. Kellogg, president, called the meeting to order, 156 members being present and 707 responded by proxy.

The keynote of the president's address was the subject of tuberculosis, and he urged federal legislation to secure uniform laws and reliable veterinarians to administer the test, and deprecated the present agitation in New York tending towards indiscriminate slaughter. On motion of Hon. P. B. McLennan of Supreme Court Bench of New York State a resolution was adopted to take up the general question of treating cattle for tuberculosis and to try to bring about the passage of laws which will be uniform in the different States and free from the provisions which, with the tuberculin accompaniments, are considered by cattle breeders and farmers to be unfair. This committee consists of President O. U. Kellogg, Secretary F. L. Houghton, E. A. Powell of Syracuse, N. Y., F. F. Field of Brockton, Mass., and R. C. Reed of Howell, Mich.

The report of the treasurer showed an income for the year of $33,055.50 and a balance of $70,499.78. The report of the Superintendent of Advanced Registry showed 2055 animals had been entered on records of butter fat. The largest record during 1907 was that of Colantha 4th's Johanna, which for 7 days reached 28.17 pounds of butter fat and exceeded all other records by cows of this or other breeds and crowns this Holstein as the queen of all cows. Her year's test by Wisconsin State Experiment Station recently reported was 998.2 pounds butterfat; also the greatest yield of any cow in the world to date.

The report of the secretary, F. L. Houghton, Brattleboro, Vt., showed registration of 16,534 animals during the year, exceeding those of all other dairy breeds by over 5000 entries; and a balance turned over to the treasurer of $31,337.43. Membership increased by 360 accessions to over 2100 total. Appropriations were made for Advanced Registry butterfat prizes, exhibitions at fairs and other purposes, amounting to $11,750. The election of officers resulted in the re-election of President Kellogg and Secretary Houghton, and three changes, including the election of J. N. Connyham of Wilkes-Barre, Pa., and I. Dalyrmple of Otselic, N. Y., to the Board of Directors and William Everson of Lake Mills, N. Y., as 2d vice-president.—F. L. Houghton, secretary.

POULTRY BREEDERS' MEETING.

The poultry breeders of Southern California will hold their regular monthly meeting in Assembly Hall, Chamber of Commerce Building, south Broadway, Los Angeles, June 25, 1908. At this meeting officers for the ensuing year will be nominated. A full attendance is desired.

A NEW IMPERIAL.

An event to take place within the next few months that will prove of the utmost importance and interest to the farmers and homeseekers throughout the United States and Canada, is the opening up for settlers of the valley of the Yaqui river.

This valley lies on the eastern coast of the Gulf of Lower California, about 275 miles south of the boundary line of the United States, and is on the Yaqui river division of south Southern Pacific Railway. The soil and climatic conditions are almost identical with those of the now world famous Imperial valley.

The work of taking the water out of the Yaqui river and distributing it over the 550,000 acres of land that comprise this valley is being rapidly pushed to completion and the owners expect to be able to offer the land to small investors late in the fall or early winter.

Owing to the fact that a great many thousand dollars are needed to complete these developments, it has been decided to offer a few thousand acres in large tracts of not less than 1000 acres each, at a price that will attract both speculators and the more conservative investors. It will be possible for the next 60 days, to buy 1000 acres at $12.50 per acre, and this price will include a permanent water right entitling the owner to use such water as he may require, at the rate of 50 cents per acre foot. O. A. Vickrey & Company, 308 South Hill street, have been appointed sole selling agents. Any further information may be obtained at their offices.

Farmers should count noses over the pig pen daily.

For Mehring Foot-Power Milking Machines see O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles, Cal.

Household Departme

THE GOAT WOULD NOT STAY.

I bought a goat from "way out West,"
 Said to be very fine,
With pedigree way up in G,
 Long as a pumpkin vine.
I wanted him to head my flock;
 Their names do not appear
Upon the roll of honer, for
 They boast no silky hair.

The pasture I turned Sir William on
 When we came home that night
From what I learned next morning
 Failed to suit his appetite.
That blessed goat had crossed the fence,
 And mowed my field of corn,
Which made me so all-fired mad,
 I wished he'd ne'er been born.

His climbing, Bill continued still,
 And I began to fence,
But every day on the topmost rail
 He would do the "cake-walk" dance.
He scaled a fence full six feet high;
 He barked all fruit trees found;
He kept my neighbors fighting mad
 For full five miles around.

His hair is long and silky;
 Worth forty cents, they say,
But I am sadly troubled—
 Can I keep him? Will it pay?
I don't see how the cussed thing
 Can live and eat such stuff;
For everything he sees he eats
 And never gets enough.

But worst of all, alas! my flock,
 Who never knew to climb,
When turned into the pasture now
 Will scale out every time.
For with association comes
 A longing for degree;
They seem to want their names enrolled
 In the book of Pedigree!

At last I'm happy, for you see
 My neighbor has the goat,
Henceforth I'll be centent with those
 That lack the silky coat;
For joy after sadness cemes
 And pleasure after pain,
We've parted, and I'm praying
 Shall never meet again.

C.—Maud, in Farm and Rancher.

BLACKETT GIRLS' REVOLT.

"I'VE SOME good news for you, Marion," said Harry Preston to his wife as he took his seat one night at the dinner table. "You remember the vacant land I beught in the suburbs a few years ago? I sold it today to a syndicate for a clean fifty thousand cash, and it cost me just five thousand. Now, with your approval, I am going to do what has been in my mind a long time, and that is to buy a place in town for my mother's sisters. There's a pretty house for sale three blocks below us on the corner which I think would just suit them. They would be near enough for us to look after them, and they would be as independent as they are now. They are getting almost too old to live alone, especially so far from any neighbors."

"Oh, Harry," said Marion, "that will be one of the best things you ever did. I have thought so much abeut your aunts since I stayed those two weeks with them last summer."

"I'm wild to see your aunts settled here," said Marion, as they were taking a final survey of the house.

The little town of Knowlesville lies at the bottom of a natural basin surrounded by gently sloping hills, which shut it away from a too curious world. Near the top of one of these hills and a mile and a half from the village, stood a gray, weather-worn house, the home of the Misses Blackett, or as they were familiarly known in the community, the Blackett girls, though the youngest of them had passed the half-century mark. The house stood in what the country folks called a "sightly place." its wide kitchen windows one see down to the village, and b the village glimpses were had c road which zigzagged back and across the hill and finally slippe of sight over the top.

"I never could abide to live i village," said the elder Miss Bl one fine, crisp morning in Octob she sat in her accustomed pla the corner kitchen window and l out over the landscape. "I th when I was down there t'other seemed 's if a body couldn't br shut in with houses each side right in front of ye, and may barn in the back. And then ye see but the leetlest mite of sky hills shut it off, I s'pose. Wh here we can see hundreds of ac sky, yes, and thousands, too, was measured," opening the wi as she spoke and thrusting eu head as if to take a mental surv the sky acreage.

"Yes, indeed," asserted Miss A Blackett, who was busy polish basket of Juicy Cut apples and ping each in a bit of newspaper, one reason why I shouldn't li live down in the village is you'd never know when com'ny comin' till they was rappin' a door. Here we can see folks f half hour 'fore they get here, and a chance to slick up a little."

"Better look 'round now and we're ready for com'ny, for body's turned off the lower read ours," was Miss Almina Blac warning from her post at the s window where she was washin breakfast dishes.

The elder Miss Blackett had al spied the traveler and divined his sonality.

"That's Mis' Howard's Hikey," said. "He's goin' over to the Tur huskin', and I asked his ma te let bring along our mail, if so be come. It's time we had a letter Henry."

"Yes," said Alzina, who had Hikey at the door, "we've got a l from Henry and five newspa That'll do to do up the best P Sourins. I was most afraid would have to go unwrapped.

The letter and papers were la the high chimney piece, for net the work was done weuld they the letter or open the papers. W the proper time came the elder Blackett cut the envelope care and drew out the letter and re aloud.

"My Dear Aunts" it ran: "Ma and I are coming to make you a visit. We shall arrive on Satu the fifteenth, and when we re which will be the following We day, we are geing to take all thr you back with us for a visit. shall not take 'no' for an answ got ready as much as you can. Marion will help you when she c Your loving nephew, Harry Prest

The three sisters looked at other.

"Comin' Saturday," said Al "and wants us to go back with Wednesday. Guess we'll have to, when Henry makes up his mind can't turn him. But what'll we with Chirpet and Mrs. Doodle Colonel and the hens?"

"We can think about that late said Miss Blackett. "What we've to do now is to clean the house company."

The Prestons were energetic peo

n Marion came in the afternoon ound Albina in bed swathed in ınnels, and Almina and Alzina with woe-begone faces beside

na's rheumatism, probably ag- ed by her unusual exercise and ıre to drafts, kept her in bed ı long weeks, and when she was o leave it she could not have a journey, even if the change not in itself have been disas- It was hard for the visitors to d with folded hands. The sit- om table was filled with books ıagazines, but the keen delight they had taken in the stray which had come through the mail was lost in the present surfeit. They grew homesick.

"My, I do wish we could go back early enough to make a little maple sweet'nen.' But we can't tap in April," said Almina.

"The first of April can't come any too soon to please me," said Albina. "I can hear—good land! how that scart me," she exclaimed, as the door-bell clanged loudly. "I never can get used to that bell. You go, Almina. I'm that upset I can't."

Presently Almina returned with a letter. It was from Mr. Preston.

"I have something to tell you that I'm sure will please you," he wrote. "I met a wealthy New Yorker here who is planning to buy a place in the country where his children can run wild and where he can go for a few weeks' rest himself during the summer. I thought of your place directly, and he is going to see it on his return and thinks it will please him. If it does he won't haggle at the price, and you can get a pretty penny for it, for of course you will never go back there to live. I expect to be home the thirtieth of March, and we can have the whole thing settled by the first of May."

Albina folded the letter and laid it down.

"What day of the month is it?"

"The 20th," said Alzina.

"I guess we can pack and get started for home tomorrow if we hurry, can't we?"

Almina and Alzina hurriedly left the room without replying, but the sound of trunks bumping from one stair to another as they were being dragged down from the attic told Albina she was answered in the affirmative.

It was late in the afternoon of the next day when the three Blackett girls, their cat and their canary stood on the doorstep of the little gray house. Almina fitted the key to the lock, opened the door, walked to the fireplace and lighted the kindlings laid when they went away, wound the clock, pulled up the shades and bade her sisters come in. Colonel, let loose from his basket, raced from room to room and cut all sorts of capers to show his joy at the home-coming. Albina sat down by the kitchen window and looked her fill at field and sky.

"Oh, girls," she said, "I ain't drawn a long breath since I went away, and now it seems as though I couldn't breathe deep enough or long enough. And I can't acount fer the sky, there's ten times as much as there was when we went away!"

Alzina lighted a candle and went down cellar. Presently she returned carrying a quantity of apples in her upturned dress skirt.

"There's a lot of sprouts on the cabbages," she said." We'll have some seasoned with pepper and salt and girls, ain't it good to have a real vinegar for our supper. And, oh! home?"—Journal of Agriculture.

RECIPES.

Baking Powder.

It is cheaper to compound baking powder at home rather than buy it in cans. To one pound, two ounces cream of tartar, take one-half pound of baking soda and put with it from one-eight to one-fourth pound of corn starch as a drier. Mix thoroughly by sifting six or eight times and can tightly. It is less harmful than alum baking powders.

Frosting Without Eggs.

Make boiled frosting without eggs. It never runs off or cracks. Take two cups of sugar and a half cup water, stirring until it hairs, then set aside to cool. When the bottom of the pan feels nearly cold begin to beat the syrup. If it begins to get hard add a few drops hot water. When it turns white it is ready to spread on the cake. By adding a few drops of hot water from time to time every bit that is in the pan can be used. The sides of cakes can be covered for it will stay where you put it. Chocolate frosting can be made by shaving chocolate in it.

Peanut Cookies.

Cream one cup of butter with one cup of sugar, add three eggs, beaten separately, one teaspoonful of soda dissolved in two tablespoonfuls of hot water, a teaspoonful of lemon extract, one coffee cup of shelled peanuts rolled fine and flour to make a soft dough. Roll thin, cut out, dip each cookie in beaten egg and rolled peanuts and bake in a quick oven.

Ham Salad.

Chop lean, cold boiled ham until the pieces are the size of peas. Chop fine half as much celery or lettuce as ham. Line a dish thickly with lettuce leaves and fill with the ham and celery. Turn the following dressing over the whole just before serving. Half cup of vinegar, one small teaspoonful of sugar, butter half the size of an egg and a dash of pepper and mustard. Put over the fire and when boiling hot stir in one-half teaspoon of cornstarch which has been mixed with a teaspoonful of cold water. Beat one egg very light and add just before removing from the fire. Add half a cup of thick cream if desired. Cool before using.

Waffles.

Excellent waffles are made from a heaping tablespoon of butter, melted, a little salt, two teacups of sour milk, in which is stirred a level teaspoon of soda, two eggs and enough flour to make a good drop batter. Beat the whites of the eggs separately. Grease the iron with lard and be sure of a good fire to bake the waffles just right.

HOMELY HINTS.

In Case of Fire.

All children should be taught what to do in case the clothes catch fire. They should not only be told, but questioned and examined as to their knowledge, until it is firmly fixed in their minds. In the first place it should be impressed upon them that they are never to run in such a case, but to throw themselves at once on the ground. The next thing is to wrap the burning individual in a shawl, rug, blanket, piece of carpet, coat, anything that will exclude the air, for fire cannot burn without air. It is well to remember, also, that cotton burns easily and wool does not.

To Extract a Splinter.

A bit of home surgery, stated to have been practiced when a splinter is driven into a child's hand particularly deep, is its extraction by steam. A bottle with a sufficiently wide mouth is filled two-thirds with very hot water, and the mouth of the bottle is placed under the injured spot. The suction draws the flesh down when a little pressure is used, and the steam in a moment or two extracts inflammation and splinter together. This is very efficacious when the offending substance has been in for several hours, long enough to have started some of its evil consequences.

Attention Ladies

The Champion Ironing Board is the simplest and, at the same time, the most practical and convenient device of its kind ever placed on the market. It can be adjusted to any table. It is always ready for use. It meets all the labor saving requirements of the busy housewife. Delivered to your R. R. Station for $2. Sold by

The Produce Markets

Los Angeles Markets

LOS ANGELES, June 17, 1908.

Butter is up another 2½ cent notch, and now stands at 52½ for extra creamery. Market is firm with only fairly liberal receipts. Quotations are as follows with sales 2½ cents in advance of quotations in the fancy grades:

Creamery ex per roll	52½
Firsts	50
Dairy	25
Cooking	21
"Butterine"	15@20
Eastern extras	50

Cheese.

Southern California	15
Northern fresh	14½
Longhorn	16¼
Eastern singles	15
Cheddars	17
Imported Swiss	30
Swiss	18½
Oregon	18
Limburger	17½

Eggs and Poultry.

Eastern eggs have been marked up, but local candled indicate a weakness and lower than quoted last week. It is thought the strengthening of the market on locals will result from the higher price on Easterns.

Eggs local candled	22½
Eggs case count	20@20½

EASY WAY OF SWARMING.

Most apiarists think it an advantage to let the bees swarm once and with all the queens' wings clipped, when the swarm comes forth the queen is caught in a Miller queen-catcher cage as she is crawling around in front of the entrance. The old hive is then removed to a new stand and an empty one put in front of the entrance. The bees, on discovering the absence of the queen, will soon return pellmell to the old stand. The surplus chamber, if there was one on the old hive, is put on the new one now on the old stand. This manner of catching the swarm is so little labor that the women-folks do not object to it as there is no handling of the swarm itself, no climbing of trees after it and it is all done, practically, by catching the queen.—Denver Field and Farm.

San Francisco Markets

SAN FRANCISCO, June 16, 1908.

Butter.

Sellers have large supplies of butter on hand and have seased buying so heavilly, and prices have declined a cent a pound during the week. Present condition is rather easy.

It is most necessary that producers deal honestly with the consumers in order to build up the market. It is evident that good honey should bear a higher price. When ripened up by the bees it is predigested and is very wholesome.

Eastern San Joaquin county will harvest a magnificent yield of wheat this season.

TABLE GRAPE[illegible]S.

Continued from p[illegible]age 671.

Courtesy.

Loving kindness is [illegible] the best way of managing workers. [illegible] goes a long way. A little kindness girls. That is [illegible] with women and should always be the reason there the head. A cu[illegible] a capable woman at little hot soup [illegible] of tea at noon or a these faithful [illegible] not much to give them comforta[illegible]nes, and it makes work. [illegible]ble for the afternoon's

Loving the [illegible] way to be faithful to it. The romance of the grape surrounds the workers, and year after year the youths and maidens find their life partners in the packing house. The history of their lives begin in the packing house, and reality takes place of the dreams of youth in which nothing was impossible of achievement. Surely, this building up of happy homes makes the watchful care of a good woman worth while. "Yes." As my forewoman used to say each season when we drove around to notify the grils to come to the packing house, "yes," she would say, "as usual we ran a matrimonial bureau at the ranch, and my best girls are married off." It is all life, however, and the grapes were well packed and none the worse for the little romances going on around them.

THE KINGSTOWN FIRE.

Dong-g-g!

Before I came to myself I was sitting bolt upright in bed.

Was it nightmare? I pinched myself. No, I was wide wake.

"Ding-dong, Fire!" echoed through the midnight air. And with one bound I was out of bed. In another instant, dressed and on the street.

"She's a goner!" yelled Jim Wilson, as he shot by the house.

"Who—what—where?" But he was gone; and like a flash I followed my natural instinct and the firelit heavens, to the other side of town.

"They're working like Trojans, but they can't save her."

"What is it?" I asked, as I caught up to Simeon Sheldon.

"The old mill. There! Can't you see the flames licking up the lumber sheds this very minute?" Sure enough. I saw them only too plainly.

"Serves 'em right—"

"Hold on, Sim," I interrupted. "What do you mean by talking that way?"

"Yes, it does! They knew what a risk they've been running with those old 'tinder-box' shingle roofs—and right alongside the railroad, too. Everybody says it was sparks from the midnight freight did it—and I guess they're right. It started on the roof of No. 1 mill."

"Look at those houses opposite. Why didn't they catch fire, too?"

"That's easy. They're covered with Genasco. See those sparks dropping on 'em now! They burn out, and don't have the least bit effect on 'em"

"What's that name, Sim? [illegible]witched! kind of stuff is it?"

"Stuff? Well, [illegible] you've never heard [illegible] Genasco Ready Roofing, made by the Barber Asphalt Paving Company, Philadelphia? Where have you been living all your life—in the back woods?"

I was willing to be "the goat," and asked for more information.

"It's the greatest stuff I've ever seen for a roof," Simeon went on, "not only for resisting fire, but for lasting in all kinds of weather. You can let it pour pitchforks, and it won't leak; or let the sun boil down on it all you've a mind to, and it'll never dry out like coal tar. Even zero weather won't crack it. The farmers around here have taken to it like ducks take to water. You see it on all their buildings whenever you go out in the country. It's a wonder, I tell you. And by the way, it's made of stuff from what they call the Eighth Wonder of the World—Trinidad Asphalt Lake. You can find out more about it than I'll be able to tell you in a month of Sundays, if you write to them Barber people for their Good Roof Guide Book."

"Yes sir,, the mill people might have had their old shacks still standing if they'd used a ittle common sense before it was too late. Any fool can learn from his own experience, but I tell you it's a wise man that learns from the experience of others."

"You're dead right, Sim. I'm going to remember that. Meantime, I've got to turn in and get my sleep out."

The extracted honey should be ripe before it is extracted, and each grade of honey should be extracted by itself so that the consumer can get the kind he wants and that there may be no mixed grades. Each dealer should have one, two and five and fifty-pound packages with a showy label, giving the name of the honey, as to its kind, the name of the grower and of the apiary. These should be sealed so that they cannot be tampered with without breaking the seal. This is made necessary by the bad reputation extracted honey has had by being adulterated.

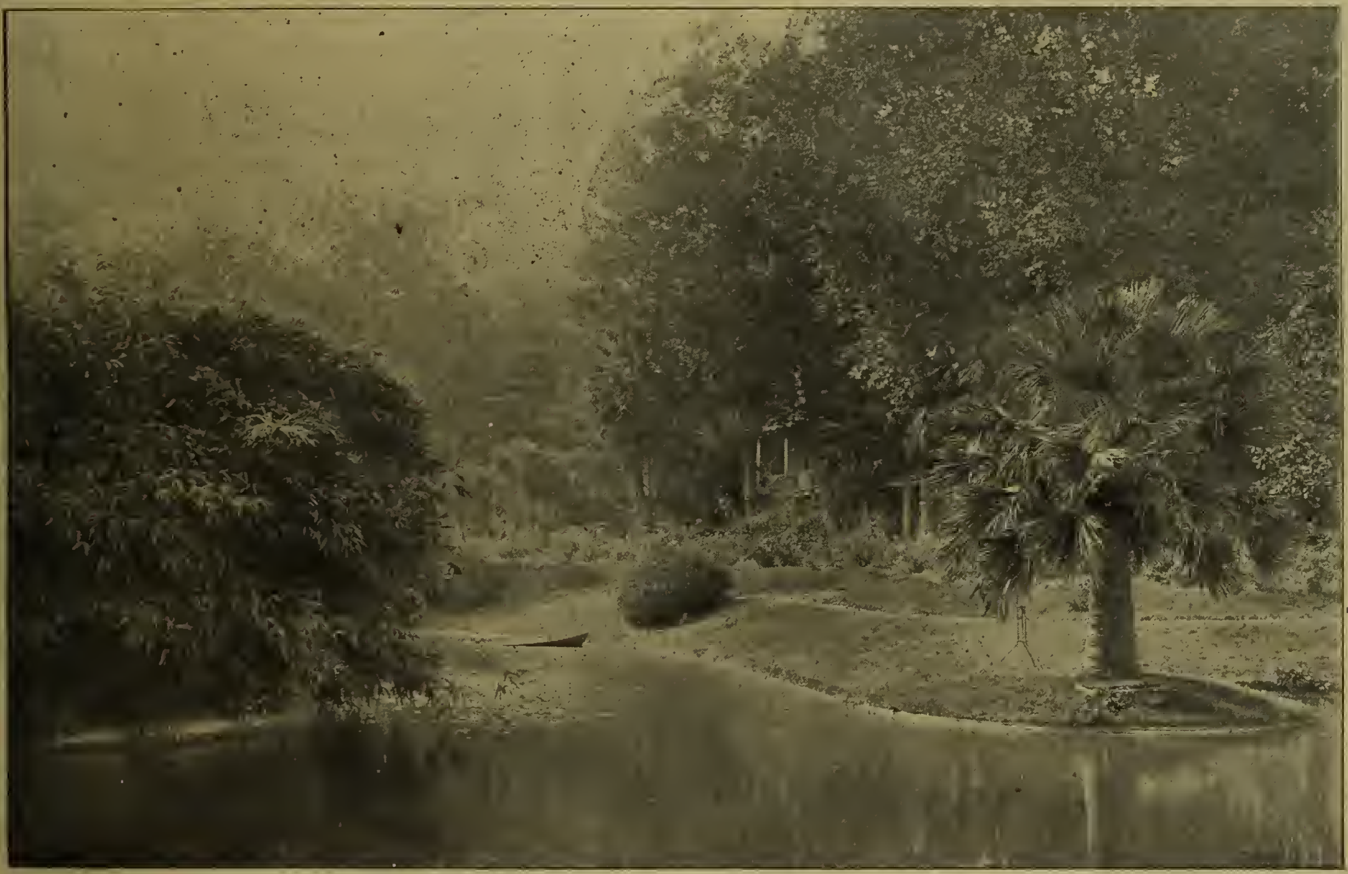
Midwinter in the Santa Clara Valley



IN A POET'S GARDEN.

RED roses that a poet's hand have nurtured into bloom—
How softly bold in color, and how daring in perfume!
Their fragrance moves the soul to peace, yet holy passion wakes;
She might lay them on her breast—and die for their sweet sakes.

Shy rosebuds that a poet's breath has since their birth bedewed,
Fondled 'gainst Juno's paling cheek might bring glad youth renewed.
In folded petals, cool, though wrought of southern light and heat,
Are crimson hues, which yet with warmth some waiting hearts will greet.

White jasmine that a poet's eyes, so full of tender gloom,
Have beamed upon in pity, thinking of its transient bloom,
Ah, who would sigh beholding now its beauty quickly wane,
Since still, to perfume life's sad morn, his verses blithe remain?

A Menace to Deciduous Fruits

Steps Taken to Make More Thorough Investigation of the Pear Thrips and Methods of Control. Meeting Called by State Board of Trade.

OR some years prune and pear growers in Santa Clara valley and within a few miles of San Francisco bay have suffered im- nse losses from the depredation of the pear ips. The Santa Clara valley prune growers re the first to become alarmed at the ravages this minute insect, which was first discovered Mr. E. M. Ehrhorn, at that time entomologist Santa Clara county. Mr. Dudley Moulton n became County Entomologist and took up work which Mr. Ehrhorn had inaugurated made quite extensive experiments, and tinued the study of the life habits of the .

ater Mr. Moulton was transferred to the De- ment of Agriculture, and under Chief Ento- ogist Howard has continued these investiga- s. This culminated last year in the issuance Bulletin No. 68, entitled the "Pear Thrips." he damage done by these mites is done by ring between the scales of the opening bud before blossoming time and eating off the of the petals and even the stem of the flow- as the blossoms open. This causes the m to fall and the fruit, of course, fails to

hile the thrips are called the pear thrips, be- se when first discovered they were infesting rs trees, yet they occupy a large number of r fruit trees, one of the worst damaged being nes. However, for the past two or three s pear growers of Contra Costa coun- ave suffered such great losses, and this sea- have found their pear trees entirely barren fruit because of the pest. They appealed to the e Board of Trade to take up the matter and re from Washington additional help to in- igate the methods of control of this pest. A ting to discuss the matter was held in San cisco on June 9th, President Briggs of the rd presiding. The president in opening the ting called upon Mr. Palmer Anderson of tra Costa county to give an idea of the con- n with the pear growers of that county. Mr. erson said that in his district growers had, two or three years past, lost almost their en- crops of pears, and in despair were prepar- to take up their pear orchards that were tically exempt of the pear blight, but were less against the thrips. We are very anx- to get some assistance in regard to the ps. It is worse this year than ever before has been spreading for the last four or five s.

hen asked regarding the use of sprays nst the insect, Mr. Anderson said: "We used lime and sulphur, but it was a hope- task, as the thrips were inside the bud where could not possibly reach them. Spraying is peless task and absolutely of no value."

ther Trees.

r. Moulton was also present and was called , and spoke as follows: Mr. Anderson in ing about the injury done to pears has only n you a small idea of what the injury to r fruits is. While thrips has cleaned out a ber of pear orchards in Contra Costa coun- nd farther north, and in Santa Clara county, rhaps has done more injury on prunes and r fruits. It was first found in pear blooms was called pear thrips. In distribution it und almost altogether close around the bay. also found from near Auburn in the Sierra foothills, and as far south as Hollister. It is an insect that attacks deciduous fruits. It is a tree feeder and it does not feed on grasses."

As to the life habits of the insect, Mr. Moulton said: "We have it fairly well worked out. The adults appear late in February or March. They are in the ground all winter. They feed on the veins of the leaves and the eggs are deposited inside. They feed for about three weeks and then drop to the ground; they generally go to the surface just below the loosely cultivated ground. When they come out of the ground they are brown insects with wings. When they come to the surface they fly up into the trees. Irrigation has no effect upon them. Cultivation will kill a few of them, but generally they go down into a break in the ground again and form a tiny cell. When you drive your cultivator through the ground as a general thing you will work around the cell but not break it. They are found immediately below the trees."

Asked as to the effect of sulphur spread upon the ground, Mr. Moulton said that he thought it would have no effect whatever. Regarding the different varieties of fruit affected and the manner of working upon them, Mr. Moulton said:

"Before discussing the injury done to pears, I will mention the injury done on almonds, apricots and peaches, as leading up to the nature of the injury done on pears. I will take almonds first. They begin to bloom in early February and open up a large blossom surface and leaf surface before the thrips come to the trees in serious numbers, so while there are many thrips we find the trees giving a heavy crop of nuts without almost any injury. After the full blossoms open the thrips gets inside the cup, but does not touch the fruit and the nut goes on maturing without much injury. That is true of peaches also. Thrips migrate from tree to tree.

"This pest has been known for about four years. I believe it was Mr. Ehrhorn who first found it in the Santa Clara valley. He did some work on it and later I did some. Then there was nothing further done on it until our department took it up this year.

Makes the Blossoms Drop.

"Apricot trees blooming as they do the last of April, come in for a good share of the injury, because then the thrips are out in great numbers. The blossoms have opened, showing just the whites of the petals and the thrips, instead of going to the inside of the bloom, follows down the outside of the blossom and begins to feed on the little stem at the base. Feeding as it does, it weakens the stem and perhaps does not touch any other part of the blossom. If you touch one of the branches, 75 to 90 per cent of the blossoms will drop off. The thrips move from tree to tree very readily. They move by their wings and are carried by the wind. We find the thrips hovering over the trees on a quiet afternoon, but they won't leave the tree when there is a strong wind on. They are distributed according to the direction of the prevailing winds. When peach trees get to about the stage when they have just shed the blossoms we find the thrips on the nectar glands of the tree, but no injury at all to the fruit."

As to its work on prunes he added: "As soon as the cluster buds spread and the blossoms start out, they go right down the center, and if we have favorable weather with ordinary warm conditions the buds will start. They begin then to rasp on the little blossom stems and the result is that the whole cluster falls after just a day or two. If they don't kill the fruit in the bud, they attack it in the blossom, and if they don't kill the blossom the larvae start to feeding on the fruit and forms a scab. Last year it was very noticeable on most prunes whenever the thrips had been present. Many people thought there was a fungus on them, but it was not so. It is a little brown scab on the end of the fruit in a circular form. Many packers would not accept this fruit.

Cherries.

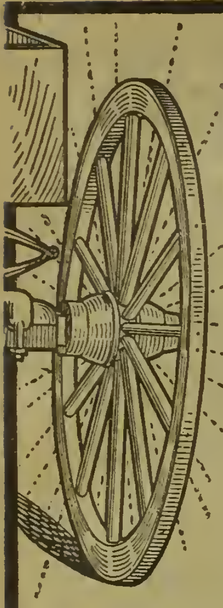
"Where the buds are just opening, we find the larvae going in and you have the ragged effect with all the buds dead or injured, and later we have the injury to the leaves. The Black Bigarreau cherry is singled out in every case and then the Tartarians. The Royal Anns are hardly touched, because the thrips get all the food they want on the earlier trees that have been blooming.

"In regard to pears. Even though some of the others are late of bloom they prefer the pears next to Imperial prunes. The opening of the cluster buds is very favorable to their feeding. As soon as the clusters start they find a large surface on the leaves and blossoms and go to feeding, the trees throwing out a gum which drops from the clusters. Pears may be very badly hurt, and yet as the Bartlett pear has a long blooming season the late blossoms may come through. The thrips may migrate to another orchard and leave those trees to blossom.

Remedy.

"We have tried almost everything we could think of on the larvae and the adults. We have tried irrigating to try to drown the larvae out, but it is not practicable or effective. Their bodies are rather oily, which makes it difficult to kill them with spray. We tried whale oil soap, but that will not kill the thrips at all. The soap washes have all proven the same thing. They don't penetrate into the breathing pores because the body is oily. Lime and sulphur act in the same way. They seem to stay on the back, but not kill them. We used kerosene emulsion and found it very penetrating, and we could use it without injury to the tree. The oil itself is very penetrating and kills whatever insects it touches, but has no disagreeable odor or lasting qualities, and perhaps 40 per cent of the thrips escape it. With distillate and crude oils we had practically no good results at all. The crude is too heavy; it blackens the foliage and blossoms and so there is considerable injury to the trees. Distillate emulsion seems to be a very good insecticide. With five per cent emulsion we used 5 gallons distillate to 100 gallons water and we killed the thrips in sight and most of those in the clusters. It stayed on the tree long enough so a little of the wash would run down to the blossoms and act as a repellant. There are two washes that have been successful, one was the black sheep dip and the other tobacco and potash. We used 1 gallon sheep dip to 70 of water. We then used 1 gallon to 10 of water or 95 cents worth of material for one tree, but killed 99 per cent of the thrips without an injury to the tree. We then reduced it to 1 to 20 and got the same results. We think that one to 50 or one to 55 would be very effective for the killing of the thrips that we can reach.

Continued on page 711.



Don't Wait 'till They Sing

You make yourself unneccessary expense for repairs every time you use a poor wagon grease or allow an axle to go dry.

An occasional application of

MICA Axle Grease

removes two thirds of the trouble and cost of keeping a wagon. Try "Mica" next time you go for a load—you'll *see* the difference and the horse will *feel* it.

Mica Axle Grease is almost as good as roller bearings. Ask the dealer for it.

HUMUS.

AT THE recent Farmers' Institutes held in San Bernardino and Los Angeles counties, Dr. R. H. Loughridge gave a lecture on humus and its effect on the soil. He stated that humus was a result of vegetable decomposition and showed pure humus in a small phial, that he had extracted from soil by means of dissolving it out with ammonia. The ammonia was afterward evaporated, leaving the black substance behind. This will burn like coal. There are two distinct classes of humus, that which acts on the soil elements and that which does not. Humus may be derived from any kind of vegetation and the two great classes of vegetation, leguminous and non-leguminous are what make the two kinds of humus. That derived from the former class makes active humus that gives life to the soil and adds nitrogen. It serves to promote aeration of the soil, makes light soils conserve the moisture by regulating the compactness and by the same means loosens heavy soils so that they will absorb more water and also retain it for a greater length of time. He stated that as a general thing, the humus in Eastern soils extended but a few inches deep, while California soils contained humus much deeper and, in many cases, was found several feet deep. Eastern soils, however, contain the most humus but the California humus is the richest in nitrogen.

Much stress was laid on the necessity of constantly adding humus to our soils in order to improve the mechanical and physical condition and also promote their efficiency in utilizing the latent fertilizing elements.

Charts were shown which demonstrated the greater rapidity with which plants grew in light soils than in heavy ones. In some cases the increase was double on the light soils, showing especially the necessity of adding humus to our heavy soils.

FACTS ABOUT SOILS.

Did it ever occur to you that the soil breathes just as plants and animals do? It is a fact that it does. Every time it rains or the land is irrigated, it exhales and when it loses its moisture it inhales. Aside from this it has less profound breathing exercises continually. The act of water penetrating the soil expels the air and as the water penetrates and leaves spaces between the soil particles, the air rushes in and takes its place. This fresh air aids the plants by making available a little more plant food and driving out the obnoxious gases that collect during the act of plant growth.

When water is applied to clay soils much of it will stand on the surface till evaporated instead of sinking in and being held in reserve for future use. Manure will improve this condition as will sand. Sandy soils, on the other hand, are improved by having clay added to them. It has been demonstrated that in this respect, humus is ten times more efficient than clay. This physical improvement in these two types of soil may make the difference between sterility and fertility.

Sand will absorb and retain about 15 per cent of its bulk of moisture while peat will absorb 70 to 80 per cent. This shows that the more humus a soil contains, the greater will be its absorbing and retentive powers.

The capillarity of soils deals with the power of water to travel around or through it in any or all directions, but it is generally referred to as the power to ascend. There are no tubes formed in the soil through which the moisture ascends as is generally supposed. It is simply the power of gravity and the power known as tension.

When two corks of different sizes are floating in a tub, they will come together with a bump if they are allowed to come within a certain distance of each other, or they will bump up against the side of the tub. This is because they are attracted by the larger body. It is the same force that makes chips collect and cling together in a pool. In the case of water or other liquids, the force known as tension compels the fluids to spread over the surface. This is why the water extends up the sides of a glass to a slight degree and on the insides of a glass tube to a greater degree. It is well illustrated in the case of a soap bubble when the stem of the pipe is removed from the mouth befor the bubble parts. In this case the tension of the liquid squeezes the air out through the pipe stem till the bubble forms a diaphram across the bulb of the pipe.

Now these two forces, gravity and tension, force the water from one particle of soil to the other, in all directions. If the soil particles are held far apart. the moisture must travel slowly. Cultivation loosens the soil and brings this condition about. When the particles settle together which they are always doing, capillary action is faster and we must cultivate soon or we will lose more moisture.—J. W. Mills.

SICILY LEMONS IN NEW YORK.

Regarding the Sicily lemons in New York and other Eastern markets, we note in the Packer the following:

Took a Slump.

The Sicily lemon market took a slump this week. At the sale of the cargo ex Ss. Liguria, 12,000 boxes, Tuesday, the market was woefully dull and prices were lower all around. It would appear without question that the Sicily lemon market at the present time is weak, but this weakness is, undoubtedly, exaggerated by the poor quality of fruit that has been offered recently. Cargo after cargo for the past few weeks has shown deplorable condition. There are some lots, of course, of good fruit, but there are many poor lots in evidence.

There is much complaint being made on the street of the way the samples of Sicily lemons are being displayed. Brokers claim that it is almost impossible to be guided by samples. They are doctored and when the brokers inspect a line of fruit the stock is made to show up as sound and well keeping when in reality the actual condition of the fruit offered is in many instances too poor to stand shipment for any distance. Brokers this week were flooded with complaints from customers for whom they had bought high priced and supposedly well keeping fruit for which they paid good prices. This obnoxious system should be stopped. Brokers are naturally inclined to be timid about taking hold of fruit unless "they have been shown."

Too Poor To Buy.

The cargo of the Liguria sold Tuesday was too poor to warrant buying

ALL ABOUT THE

Orange and *Lemon*

Is told in our new book on Citrus Culture, embracing every phase of the subject from the seedling bud to the final disposition of the fruit in the Eastern market. The largest and best book on the subject ever printed — 50,000 words, 100 illustrations. You will want a copy, which we will send you for the small sum of 25 cents. Remember we are the largest growers of orange and lemon trees in the world.

market is lower and the de-
less active than a week ago, ow-
the cool weather up north,
prevents green fruit shipped from here from ripening, and the heavy receipts of Cuban pines.

In consequence of these conditions, extreme caution should be used in picking and packing fruit, as only the best bring good prices.

Some growers to the south have realized very good prices and one grower as much as $2.50 f. o. b. for pines in good condition and well packed.

From a report received from Mr. E. P. Porcher, general agent of the I. R. and L. W. Pineapple Growers' Association, dated May 12, his last sales netted from $1.30 to $2.02½ per crate.

Twenty-one cars have been shipped by him from Jacksonville to northern cities, and several of these have been exported, but the returns from those exported are not known.

Whenever the pineapples in this district are small the slips are also small, unless the plants are heavily fertilized after the fruit is shipped, and the slips are allowed to stand on the plants until August.—Palm Beach News.

Our pineapple crop is fair this year and the size of the fruit is desirable. I have shipped 350 crates, some for England and some for domestic markets; now we can ship one or two cars each week from Yamato. Our crop of pineapple are about half on old plants and 20 per cent on young but the fall crop will be very heavy.

Growers have been picking tomatoes for three weeks from the plants which we set out after the frost last February, but a heavy hail visited here, and destroyed more than 90 per cent of the crop in Yamato; only seven acres of my own field was safe; however, we are picking from one to two cars of tomatoes every week.—West Palm Beach Tropical Sun.

CHERIMOYA.

The Cultivator office was recently favored with a magnificent specimen of the cherimoya or Anono, or, as some call it, the custard apple. This fruit was grown by Mr. James Fullerton on his little ranch, the Twin Palms, at Orange. The tree on which it was grown was received by Mr. Fullerton by mail in March 1904, and is now between four and five years from the seed. It has borne four apples weighing from one and one-quarter to one and a half pounds and now has a number of smaller fruits coming. The fruit is very luscious though to some it is considered sweet and insipid, but we believe such fruit if cultivated in any quantity in this State will add materially to our wealth. It is a favorite with the wealthy and sometimes has been sold as high as $2.50 for a single fruit. The seedlings of various trees vary to a certain extent and it is necessary to bud or graft to be sure of the finest strains. This one which Mr. Fullerton has surely is one of the best.

SMALL CROP IN FLORIDA.

The orange crop will be short throughout this part of the State and indications are, judging from reports from various sections, that the crop will be short all over the State, even shorter than last year's crop. This is on account of the extremely dry weather which caused the young oranges to drop after growing a few weeks. The bloom on the trees was never more prolific than it was this spring, but everything living must have water and where there is no irrigation there will be few oranges. Grapefruit seems to make a better showing and the indications at present point to a fairly good crop. Nearly every day heavy clouds appear and everyone rejoices expecting to at last get the much needed rain, but the clouds pass over with but a few drops of the welcomed article left behind. However, Micanopy is hopeful and in the knowledge that it will not always be dry; that is, dry for the want of water. Her growers will continue to plant another season, let us hope, with better success.—The Packer.

The sweetest fruit may have come from the bitterest root—but who cares how bitter the root, if sweet the fruit.

Deciduous Fruit Cultur

SULPHURING GRAPE VINES.

BIOLETTI SAYS there is, perhaps, no disease of the fruit of the grape that causes more trouble than mildew. If it is not taken in time it renders the fruit practically worthless in bad cases, and in any case, decreases the yield and detracts from the quality and appearance of the grapes. It is not confined to neglected vineyards by any means, but is worse in rank, dense foliage than it is in thinly growing vines, because the fungus on which the disease thrives best is in places where the moisture is retained longest.

The greatest damage is done about blooming time, still there are exceptions to this. During the months of July and August it is usually too dry for the fungus to thrive; however, on land that has been irrigated or where there is a dense and luxurious growth of vines, much damage is done as late as midsummer.

When grapes have attained their full growth, it is not likely that mildew will affect them, though it sometimes does. With table grapes it often discolors them so as to reduce their market value, while with wine grapes the same amount of mildew would not amount to appreciable injury. It is not safe, however, to allow mildew to infest a vineyard at even such a late date. While the present crop is safe, much injury may be done to the vines. An attack of mildew in September or October will seriously impair the crop for the following year. At this season it attacks the interior of the vine; that is, the base of the canes and the dense foliage at that point where it is most shaded. This causes imperfect ripening of the wood and improper development of the buds. This results in poor growth and a small crop the following year. Canes which are black or stained by a late attack of mildew are not healthy and in severe cases may not start out the next year. Buds lower down will grow and often will set a light crop or none at all. It should be a rule, therefore, to keep the mildew out of the vineyard at all seasons of the year when growth is active.

Late sulphuring requires more material and is more laborious than early sulphuring, owing to the more abundant vines. The amount of sulphur used in most California vineyards is, however, much larger than is necessary.

This is because it is not properly applied. These facts have been worked out by Mr. Bioletti, and tests made by him are of great value to the grape growers of California. His tests were made in a vineyard of Tokays planted 9x9 feet. Vines with a spread of two to three feet required about 5 pounds of sulphur per acre. With the ordinary tin shaker, about 7 pounds were used per acre, while when the sulphur was simply thrown in by hand, 12 pounds were necessary to do the work properly. With large vines, the contrast was still more striking. With the best machine tests, one acre of vines can be sulphured in 56 minutes with about 8 pounds of sulphur. With the shaker it took a little longer and about 30 pounds were needed, while with hand sowing it took 69 minutes and required 43 pounds of sulphur.

These figures show that the three sulphurings usually given in May, June and July, applied with the sulphuring machine, required pounds per acre, the hand shaker pounds and when thrown on with hand, 80 pounds per acre were u If we reckon the price of sulphu $2.50 per 100 pounds, the cost of amount wasted by the ordinary de of a perforated tin shaker would $12.75 per ten acres, and if the phur were thrown on by hand, the would be $20.00 on every ten ac The latter figure is nearly twice cost of a good sulphuring machine.

The machine gives the additio benefit of ease of application, it be equally easy to apply the sulphur all parts of the vine, while at the sa time the work is more thoroug done than with any other method.

Mr. Bioletti says that his experien is that sulphur properly applied right time will thoroughly contro mildew, and in every case he inve gated where suphur was said to effective, it was found that the had been improperly done.

SOME PATENTS.

In the Scientific American we the following patents issued for tions of interest to farmers: F pickers' platform, C. A. McDe Sultana, Cal. The platform is in the form of an annular segmen tending about halfway around tree, suitably mounted on legs of ficient height to bring the picke into easy reach of the fruit on branches.

Corn harvester, R. B. Brewe ford, Kan. This farm wagon at ment is particularly adapted for vesting Kaffir corn, but may be for ordinary corn.

Insect destroyer, G. W. Dar Edna, Tex. An object of the inv is to provide a simple, strong an ficient destroyer, by means of w the insects and more particularly weevils and the like can be remo from vegetation and destroyed, which does not interfere with the dinary cultivation of the vegeta and does not injure the same in way.

Corn gathering and husking chine, N. M. Anderson, Galva, The invention is an improvemen machines for use in gathering husking corn in the field and charging the same into a wago other convenient means for recei it, all of the operations being formed automatically as the mac is drawn over the field.

NITRATE OF SODA FOR DE UOUS FRUIT.

A German bulletin gives inter results with nitrate of soda use cherries and apples. Illustr show graphically the differen yield when this fertilizer was and when it was omitted. A tions of as much as 50 poun acre did not give injurious

Injury to fruit trees whe fertilized with nitrate of s shown in the young shoots th brown and wrinkling up as th burned.

As a result of ten years' experie in the use of fertilizers in connect with potash and phosphoric acid, writer holds that not only is the trate beneficial and profitable, but those who would secure the great returns, it is indispensable.

Here is food for thought for the ciduous fruit growers of Califor

s so generally supposed that decid-
s fruits do not need fertilization,
t the subject is dismissed without
her thought. When we stop to
ık that the best paying peach, pear,
rry or any other kind of a decid-
s orchard in California, will al-
's be found on the best soil, it is
ıfe guarantee that fertilization will
) the great majority of deciduous
ıards, if not the best. There was
me when it was not thought nec-
ıry to give more than a very
ht application of fertilizers to our
us groves, but there cannot be
ıd an orange grower in Southern
fornia today who will not say that
'y fertilization pays.

E THOROUGH WITH YOUR SPRAYING.

What is worth doing is worth do-
well" is an old adage and no-
re is it more true than in the use
ırsenical sprays for the destruc-
of the codling moth. When you
e sprayed a few trees for the pur-
of filling the blossoms with the
on spray, stop and inspect what
have done. If you find every lit-
olossom cup filled with the poison
y, you may be satisfied with your

ılid happiness we prize,
hin our breast this jewel lies,
hey are fools who roam;
world has nothing to bestow,
our own selves our bliss must
flow,
that dear hut,—our home."

California Horticulturally

MUCH FRUIT WILL BE DRIED.

IN VIEW of the statement that no action will be taken deterimental to the dried fruit interests on account of the sulphur ruling until the matter has been considered by the referee board, and the further assurance that that Board will not meet for a year from next August, apricot and peach growers are more at ease, and very much of the crop of both these fruits will go to the drying ground, as there will be much undersized for canning.

FUMIGATION IN THE NORTH.

The necessity for fumigation for scale pests is becoming recognized in the northern portion of the State, which has stood out against this method of fighting insect enemies for some time, chiefly on account of its cost.

In Glenn county, the owners of orange trees had them fumigated for the yellow scale, which is one of the worst orange pests of that section, and now orange and olive growers at Fair Oaks, in Sacramento county, are agitating the question of fumigating for black scale, which has increased with such alarming rapidity in that section as to threaten the lives of the trees themselves, and to reduce the crop of marketable fruit to the lowest point.

FEWER PESTS THIS SEASON.

From reports received from different fruit sections, there appears to be less trouble from insect and fungous pests this season than usual, which is probably due to the meteorlogical peculiarities of the season. Peach fungus is giving little trouble; shot-hole has been less destructive than usual, while little complaint is heard of army insects, which usually appear in some sections nearly every spring. No swarms of grasshoppers, outside of the high mountain sections, have been reported; cutworms or army worms have been reported from few points, and the swarms of these are not large. In San Mateo and other coast counties there is a visitation of the oak moth, which is defoliating the live oaks, but this is not injurious to fruits. The dry, cool weather of the early spring months was not favorable to fungous growth; the spores were dried up and few germinated.

SHORT COURSE AT THE UNIVERSITY FARM SCHOOL.

The University Farm School at Davis is now ready for active operations, and a Farmers' Short Course will commence in October and continue until the end of November. It is gratifying to note that California has got what she has long needed, a genuine agricultural school, separate from the University, yet connected therewith. The summer course is a very excellent one and as it is open to all people over 17 years of age, there should be full classes.

THE TUSSOCK MOTH.

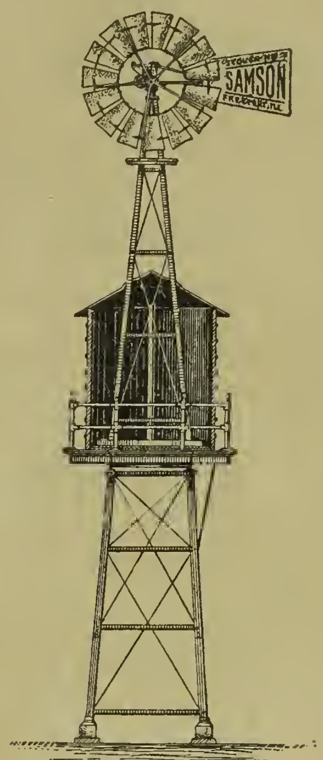
The Tussock moth has again appeared in numbers in the apple orchards around Watsonville, and County Entomologist Volk is doing excellent work in fighting it. This pest is a very difficult one to handle on account of its remarkable resistance to poisonous sprays, but Mr. Volk believes that he has now succeeded in applying a wash which will catch it. It is a fortunate thing that there is a number of parasites which prey upon this moth and these have kept it in check in the past. We remember, a number of years ago, when the Tussock moth was regarded as one of the worst pests in the State, being very generally distributed and as bad as it now is at Watsonville, but its natural enemies increased to such an extent that they overcame it, and for many years it has not been considered a serious pest. Lately, however, this outbreak has occurred in the Watsonville section and the apple growers there have become very justly alarmed.

NORTHERN FRUIT CROP GOOD.

As the season advances there are no unfavorable reports of fruit conditions in the deciduous sections. Cherries, apricots, early peaches and plums are now being shipped, and all of these are yielding heavily. Later fruit is showing up equally well and altogether 1908 promises to be a record year so far as fruit in Caifornia is concerned. Apricots are somewhat undersized, and the percentage of first class fruit will be small. This is due, to some extent, to the neglect of many growers in thinning.

Sulphuring on a big crop of grapes about Biggs is proceeding.

SAMSON WIND MILLS
Have double gears, removable bearings and center lift, which double the life of the mill. They will last longer, pump more water and give better satisfaction than any other WIND MILL.



This is an up-to-date Sub-structure, Tank and Wind Mill outfit complete; substantial, economical and attractive. We build all kinds. Write us or our general agents for full information and prices, description &c., before purchasing.

Small Fruits and Vegetable

A SWEET HERB GARDEN.

Take the richest, sunniest spot for your experiment. Add liberal supply of thoroughly-rotted manure, have the plat spaded or plowed, then worked and leveled, so that the soil looks mellow and smooth. When you take charge of your herb garden, mark the plat into long and narrow beds, with room for paths and for convenience in weeding. Some of the sweet herbs are perennials, and when once well established will live from year to year and flourish anew each summer.

Let us start with the homely sage, the friend of the common cook, used wherever roast pork or stuffed fowls are well served. Sow the seed in rows about one and a half feet apart. When they come up and are "well set," as the gardener says, you must thin them out until the plants stand six or eight inches apart. Let them be until they begin to crowd, which will probably not be until after the crop is off in the second year. Then thin until they stand about one foot apart and leave them indefinitely. By leaving the first plants near each other you may secure a crop much earlier than by the old way of transplanting. The proper time to harvest the sage is when it is just beginning to bloom. Cut the tops off evenly just as far down as the bright green leaves; those nearer the base of the stalk are usually thick, brown and dry. Tie the cut stalks into little bundles and let them dry in the sunshine. The quaint hues of leaf and blossom blend into a silver-gray ,and the fragrance of the drying leaves is most wholesome and appetizing. There is always a market for well dried sage.

Caraway may be planted rather thickly in the drills. But when the young plants are three or four inches high, thin to about ten inches; let them stand until the second season and thin again to twenty inches, or even two feet apart. This herb will not yield much the first season, in some places not at all, but the second year brings a good crop, and after that a never-failing harvest may be expected. The seeds must be picked as soon as they begin to dry, for they have little flavor if left to ripen on the stem. Cut the flower heads and spread them on papers in a clean, cool, shady place to dry slowly. When the seeds are thoroughly ripe and dry, rub them from the stems, winnow them clean, place in air-tight jars to preserve the strength. Ordinary glass preserving jars are convenient for the purpose. Caraway seeds are used in cakes and bread, and the Germans are fond of a caraway-flavored drink called kummel. Druggists and confectioners are always looking for pure, dried caraway seeds.

Thyme may be sown in drills only one foot apart, as it is a low, compact grower. Sow quite thickly and thin to six inches, and then one foot apart when the plants begin to crowd. When the lower blooms on the blossom stalk are open, cut the tops down to where the leaves are no longer fresh, make into small bundles and hang up to dry. Thyme is used by old world cooks for seasoning fish, soups and gravies.

Lavender is a beautiful plant, but very difficult to raise. Plant it in drills one and a half feet apart, th
out the young sprouts to ten inch
and more as they begin to crowd ea
other. The flowers are the only p

The Ornamental Garden

A BEAUTIFUL VIEW.

A beautiful view from door or window is of more value than a costly picture. The latter varies slightly under different lights, it is true, but is ever essentially the same. A landscape, on the contrary, though its most salient features are unchanged, is never quite the same for two sucessive days, one might almost say, hours, for its expression under the morning sunbeams differs from the one it presents in the afternoon and at sunset, and still more widely under the white radiance and blurred definitions of the moon. And then there are all the wondrous and entrancing transformations wrought by the change of seasons.

The delicate hues of unfolding leaf and flower in spring, the strong contrasts of sun and shadow in summer, the gorgeous color effects of autumn. Who can make a pecuniary estimate of the interest, the mental and moral uplift of such a panorama?

Beautiful views are almost exclusively among the privileges and advantages of the country home. Very few situations in the city can, in the nature of things, command an extended and entirely pleasing prospect. Dingy walls, boxlike outlines, chimneys and smokestacks, all the sordid accompaniments of industrialism and human gregariousness meet and offend the aesthetic sense on every side. For the urban residence, therefore, the picture must be the substitute for the view.

In selecting the site for even the most unpretentious farmhouse, convenience should not alone be regarded, although to practical people of great importance, but the demands of taste to say nothing of the actual enhancement of values to the property in an advantageous situation of the buildings merit, at least, equal consideration. Then, when the house has been built with reference to the outlook, care must be taken in the planting of trees and shrubbery, making due allowance for growth, not to obstruct or restrict the range of vision in those directions in which the views are most attractive.

This can best be done by stationing an observer at certain windows and doors and calculating what will be the height and spread of a tree in a few years. Of course, where shade is desired as speedily as possible, rapidly developing trees, such as eucalyptus, peppers, and others of the same character may be interspersed with those of more enduring nature, with a view to cutting out the former after a few years.

It is not in accordance with the rules of landscape gardening to plant trees in rows, except such as are designed for wind-brakes. Nor should shade trees be evenly dotted over the front lawn. The preferable arrangement is in groups, leaving wide spaces, especially directly before the residence, with only two or three tall trees a little to one side to afford grateful shade from the southern and western sun.

TRANSPLANTING.

Never transplant when the soil is wet. It is better to transplant on a bright day, when the earth is dry than on damp or wet days, despite the general belief among amateurs to the contrary. Dry soil will pack much better around the roots, and the roots need more hospitality than the upper bodies of the young growths.

Water the plants thoroughly the night before they are to be moved. When ready to transplant, make the holes in the garden with a trowel, each to be large enough to take all the roots without crowding, but no larger.

Then bring the plants out. As soon as a plant is out of the pot, set it in a hole, press the earth firmly, but very gently around it; pour water in, wait till it has partly disappeared and press more earth around it.

When all the plants are in, work the earth very fine and smooth around each one, taking care that the upper layer of the soil seems perfectly granulated and dry. If wet spots appear after all the plants are set cover them with a sprinkling of fine earth. This is the mulching that these tender things need to keep moisture about their roots instead of letting it escape to the upper surface of the ground. Do not make the mistake of covering the plant itself in any way to "protect" it. If the roots keep cool and damp, as the mulching should keep them if it is done systematically for some days until the plants' show that they are thriving, the roots will take care of the rest of the plant.

IN RIVERSIDE PARK.

Of all the climbers the clematis family is the finest. The vines are more delicate and refined in beauty and growth than any of their rivals, but on account, perhaps, of the price being rather high and of more than usual care being required in starting them, they are by no means as often seen as could be desired. The purple Jackmanni is the largest and showiest and is in the greatest demand. It is a rapid grower and will climb many feet in one season. More of this variety is sold than all the others put together. There is no reason why this should be so, for there are several other varieties almost equally beautiful. The Madame Eduard Andre is a lovely crimson and a profuse and constant bloomer, perhaps exceeding all others in this respect. Its blossoms appear continuously from spring to fall.

Live Stock and Dairy

THE NEW WAY.

THE "horse doctor" formerly was a quack. He picked up a smattering around the stables of the racing men. The knowledge he lacked he made up by bravado. By the time he was gray headed he learned a few things that it was not well to do. He was trained like some people by the expensive school of experience, at the cost of much suffering on part of the animals and expense to the owner. He always charged all the people would pay. Today we have a noble class of men in the ranks of veterinary medicine, recognized as full-fledged members of the regular profession of medicine and surgery, affiliated closely with the scientific men of the medical profession.

The old idea was that a sick animal was to be left alone to die or get well with possibly the aid of some dose devised by the wild imagination of the stable boys. A favorite dose used to be boiled peach leaves for colic. By the time the leaves were gathered and boiled down to a pulp the horse was well or dead. If he was alive the dose was drenched down him and he was "cured."

How To Give Medicines.

The drenching of a horse is often attempted by unskillful hands and the animal receives a portion into his lungs; after a few days of suffering, dies. I had a man that knew absolutely nothing about horses and in one of our absences from home attempted to drench a four-year-old draft horse; when the horse resisted he had him thrown down and drenched him through the nose. When we came home an hour or so afterwards he told of it. He felt abused when we told him the chances were against the horse, for it was not proper to drench a horse through the nose. Sure enough the poor creature had received enough of the drench into the lungs to die within a few days.

Appliances.

Today the science of veterinary medicine has advanced to the point of making the regular doctor's outfit nearly as extensive as the instruments used by the regular medical attendant of the human family. The pop gun that shoots the ball of medicine down the throat of the astonished horse is one that is in common use. It often alarms the patient so greatly that it is weeks before he will open his mouth for the bit without a struggle. There is now a long list of hypodermic medicines for the horse. These are put up in neat cases with syringe and full directions. These are first aid rather than for dispensing with the veterinary surgeon. While I never hesitate to give a hypodermic to a horse with acute pain, still I send at once for a veterinarian; the prompt use of morphia often saves a rupture of the bowels.

Old Horses.

In California it is safe to say that nearly every old horse that dies while still useful, dies from stomach or bowel troubles. I sometimes think that the horses on the ranch would live forever if sudden colic did not carry them off. Now these faithful old friends need to be more carefully fed than the younger horses. They need to be watched; a little oil cake and bran mixed with dampened rolled barley will keep them thrifty for a long time. The old horse has a value from training in vineyard work that adds to his work greatly. He never tramps vines and any kind of a two-legged biped can handle him. He often is far wiser than his driver and more careful. Save the old horse for the slow, careful work and push the young one into doing the heavy or fast work.

"Floating" the Teeth.

The old horse, and, indeed, many young ones, have rough irregular teeth; these sharp edges wound the sides of the mouth and the food is bolted instead of chewed carefully. The veterinary dentist uses a broad file after pinching off the sharp points to make the mouth level once more. In California we often feed foxtail hay. The sharp points run into the mouth and often a mass is found under the tongue. Once a day the hands should be put into the horses mouth and all these pulled out. It is common to find horses that have breath so offensive from the rotten mass in their mouth that it is noticeable as you pass them tied along the racks.

Helps.

Many young horses bolt their food too rapidly for perfect chewing. There are corrugated iron boxes to prevent this as well as several other patents. The cobbles from the washes large enough for the horse not to be able to swallow make the cleanest things to use in the feed box. Three of these will alow the feed to drop between them, and the horse's nose must be pushed down to nibble up his grain. A mixed diet often helps the young horse as well as the older ones. Chopped up pumpkins or beets or carrots, five or six pounds once or twice a week, will take the place of green grass. Where a family horse is kept, if the cook will be careful to keep the tops of beets and outside leaves of lettuce and cabbage clean and free from grease, the horse will be greatly obliged to the hands that kindly add them to his food.

Fears.

The only fears that come to the horse owner should be the fear of not watching his health. A little extra care will make a horse live a long time and keep well. Every stable should have a half barrel to give a horse a foot bath when necessary. It should also have a three-yard Jersey bandage to be used on the leg that swells or stocks. The bandage is put on beginning at the hoof and after it is well wrapped, it is wet, then a pant leg or anything to keep it warm is slipped over it. This is the only water that should ever touch a horses' leg. Keep the hose off him and watch his teeth. Do not overwork or overload him. He will then serve you twenty or more years. I am driving a mare eighteen years old that has never lost a day from work by sickness since she was put into harness fifteen years ago. She is sleek and active as a well fed cat. Today she will out-race any colt in the pasture for the fun of going. Yes. Good old Morgan blood. Pity there are not more of them. They are spirited, but gentle, intelligent and loving to their owners. Nearer, perhaps, to the description of the Arab horse that lived in his master's tent with the children than any horse we have had in the country.—M. E. Sherman.

Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

HOW TO GET RID OF CAT TICKS.

The following brief directions ridding cattle and premises of Texas fever tick, prepared by Dr. F. Steddom, chief of the Inspec Division of the Bureau of Animal dustry, are issued as an aid to work of tick eradication which been undertaken by the Bureau in operation with State authorit This circular is especially applica from midsummer until the follow April to localities where but few tle are kept.

If the Southern farmers will make a united effort along the l indicated and thus co-operate w the local officials and this Bureau attacking the tick problem, m headway will be made, and our ul mate aim—the entire eradicati the tick and its direful conse to Southern agriculture—wil in measurable distance of acco ment.

The destruction of ticks wh on cattle and premises is the fi in procuring a free cattle traffic. following suggestions are, the made for the purpose of as owners of small numbers of tick tle to get rid of the fever ticks.

The term "ticks" as here used pecially applied to the fever These ticks are the more abunda the latter part of summer and the other kind being rarely p after the month of July. All are harmful, however, and shou destroyed.

The term "cattle" should be u stood to include all cows, steers, heifers, yearlings, calves and ox

Tick-free premises are th which there have been no ticky mals for nine months previously

The Hand Picking and Gre Method.

Cattle and premises may be from ticks by hand picking the c even though they are allowed to on ticky premises, provided they controlled and no other animals permitted on the premises. method of hand-picking and gre is most suitable in cases where are but few animals or for herds where the conditions for gr ing can not be changed. The me consists in carefully examining the cattle daily and picking or s ing off the ticks.. In this conne it must be remembered that h and mules sometimes carry ticks, therefore, these animals must al thoroughly and frequently exa and the ticks removed., The gre care must be exercised to collect destroy all the ticks removed. true that while this process is on the animals will get more ti them if the premises are ticky by diligently destroying all the ticks the supply finally gives o account of the seed ticks havin ished.

Arrange to examine all the and pick the ticks at least other day. All parts of the an especially the insides and back of the thighs, should be examin ticks. If any of the cattle are cult to handle, they should be d into a chute or narrow pen mad the purpose and where good ligh afforded. Ticks can be seen be sunlight. Ticks must not be thr on the ground, but should be plac in tin cans or other convenient sels and carried to a suitable p and burned or otherwise totally d royed, or they will lay eggs, and ed ticks will hatch in countless ımbers. Begin now to pick ticks ıd be sure that not a single tick ma- ıres on your cattle after September As a result of your trouble in ob- rving the precautions herein indi- ıted during the summer and fall, ıe cattle and premises should be ee from ticks by April 1.

To assist in preventing ticks from ettıng on cattle the cattle may be eased at the time of picking or as ten as may seem to be necessary. he greasy solution is obnoxious to ıe ticks, and if the legs and sides the animals are treated in this anner, the ticks will be less apt to awl on them.

In greasing cattle, use Beaumont ude petroleum or any crude oil, cot- n-seed oil, fish oil or lard. The fol- wing mixture will be found useful r this purpose: One gallon, of erosene, one gallon of cotton-seed l and one pound of flowers of sul- ıur. Any of the above may be ap- ied with a sponge, swab or brush, ıd should be thoroughly rubbed on l the lower parts of the cattle and least halfway up their bodies.

he Tie-Rope or Picketing Method.

This method is practicable where ere are only a few head of cattle. consists merely in picketing the ıttle out on tick-free pasturage. he cattle must be occasionally oved and the places where they ave been must be carefully avoided r some nine months thereafter.

he Two-Field Method.

On or before September 1 remove l cattle (including young stock ıd calves) from the pasture or range here they are to be kept after arch 15 of the following year. Do ot permit any cattle, horses or ules on such pasture or range dur- ıg the period indicated. If the remises in which the cattle are laced during this period adjoin the asture or range where they are to be ept after March 15 it will be neces- ry to set the dividing fence over me 10 or 20 feet on the pasture at e time of changing the cattle in arch. Be sure to examine every ead of cattle carefully for ticks be- re changing them in March. If cks are present on the cattle at this me and are not destroyed the pas- ıre will become infected and the ork will have to be done over again. the ticks are frequently removed y picking and the cattle are greased nmediately after they are taken om the pasture in September, the anger of future infection will be reatly lessened.

onclusion.

Any of the above methods may be llowed from midsummer until the llowing April.

Select the method best suited to our conditions and carry it out vig- rously. Help your neighbor to do he same.

Be sure that no other cattle pass ver the premises where your cattle o unless the other cattle are kept ree of ticks.

Do not let a single tick mature after eptember 1.

If everyone will do his part in get- ing rid of ticks the cattle quarantine vill be removed.

Water the stock, but never the ilk.

Cream Separators, all sizes, all prices. . J. Weber Co., 555-557 S. Los Angeles treet, Los Angeles.

AFTER-BIRTH IN COWS.

In my opinion sufficient attention is not given by dairymen to the "cleaning" of their cows after calving, and the retention of portions of the placenta, or after-birth, is a frequent cause of sterility and abortion in these animals.

Naturally the "after-birth" comes away cleanly of its own accord. Occasionally it is retained for over twelve (12) hours, and in these latter cases it is necessary to adopt treatment. Often the administration of a drench containing the following brings about the desired result: One ounce ammonia carbonate, twelve ounces sulphate of magnesia (Epsom salts,) two ounces common table salt, and one ounce of powdered ginger. Dissolve these in two pints of warm water or ale, and add a cupful of treacle. When thoroughly mixed the drench is given by the mouth with usual care.

If the "after-birth", remains intact after the drench has operated it is necessary to render assistance by passing the hand and arm, lubricated with carbolised vaseline, into the womb, and exercising gradual traction.

If the whole of the membranes have not been completely removed, and the discharge becomes foetid in character, the womb should be irrigated in a manner similar to that practiced in cases of contagious abortion. To do this all that is required is about one and a half yards of rubber tubing, one inch in diameter, and fairly stout; a glass funnel (bottle with bottom knocked out will answer,) and a supply of corrosive sublimate in tabloid form. The funnel is attached to one end of the tubing, and the other end, after being lubricated, is gently passed by means of the hand into the mouth of the womb. The corrosive sublimate is dissolved in water in the proportion of one part to 3000 parts, and then poured into the funnel which is held higher than the animal, so that the fluid passes into the womb. When the womb has been irrigated with a sufficient quantity, usually about a quart, the animal ejects the fluid, and frequently portions of the retained membranes will come away at the same time.

This treatment should be repeated daily until the discharge assumes its natural appearance or ceases. The buttocks and tail should also be washed down with the corrosive sublimate solution, which is a reliable germicide.—Agricultural Gazette of N. S. Wales.

FARMERS' SHORT COURSE.

Instruction in practical agriculture will be given at the University Farm at Davis next October and November. Courses in dairy manufacture, irrigation, soils, crops and cereals; poultry husbandry; animal industry; horticulture and viticulture will be given.

The course will extend from October 5th for eight weeks.

Different animals digest different portions of their feed. A steer fed on cornmeal will digest, it is said, 60 per cent of the protein in the corn, 93 per cent of the carbohydrates, and 92 per cent of the fat. A hog will digest 38 per cent of the protein, 94 per cent of the carbohydrates, and 80 per cent of the fat. The low digestion of the protein by cattle is the reason for its being a loss to fatten beef stock without hogs running wth them.

EVERYBODY BUYING DE LAVAL CREAM SEPARATORS

That's very nearly the case this year—from Maine to California and Canada to Florida. The New Improved 1908 DE LAVAL machines are simply "Sweeping the Field."

If you have seen and tried a new 1908 DE LAVAL separator you know WHY. If not you have but to see and try one to know WHY.

A new 1908 Catalogue—as interesting and superior as the machines themselves—is to be had for the asking.

LICENSE AUTOMOBILES.

The State of Ohio has a recent enactment by which all automobiles within the State must pay a $5.00 license fee. This regardless of the value of the machine. In addition, the machine is taxed by the regular tax collector the same as any personal property. This has caused much complaint on the part of automobile owners, but it appeals to us as having much merit. Of all the strong arguments in favor of good roads the automobile owner puts up the strongest. We believe, as a rule, everyone of his claims is good, but we believe his appeal for better roads would be received with more consideration by the great bulk of our people if they could feel that the automobile owner was bearing his share of that expense.

Much of the road improvement is maintained by abutting property owners, more by certain districts of each county, but an extremely small portion of it by State or general taxation. We believe the slight addition to the road fund which would be made by a nominal tax on each machine in this State, would be fair and at the same time advance the cause of good roads more than any other step which could be taken.

Much of the prejudice against the automobile is unreasoning and comes from ignorance of its true worth. This, we believe, is gradually disappearing with the more judgment used on the part of drivers of these machines, and we believe this step should be encouraged by automobile owners in order to show farmers who are more heavily taxed than any other class, the willingness of the machine owners to do their share. Occasionally a farmer in this State is joining the "cranks," which is an indication of the growing popularity of the machine.

TAFT AND SHERMAN.

The Republican National Convention finished its work quickly and well. Its nominees are able and conscientious men, its platform clear and unambigious, despite the fact that the opposition will claim the injunction plank a straddle. Above and beyond all other factors lies the fact that the Roosevelt policies controlled the convention, and as party platforms go, the Republican nominees are pledged to the aggressive fight for a "square deal." Tariff revision is one of the planks, and therein it has an interest for California producers.

OPPORTUNITIES FOR YOUNG MEN.

The opportunity for young men to secure positions where trained and intelligent service is required, is growing greater every day. The government in its various departments alone has openings for many of these trained workers to an extent that it is unable to secure anything like the number required. The Department of Agriculture has calls every day to solve problems, some of which it is unable to take up because of lack of the right men to send into the field.

We believe that scientific agriculture along other lines never had such openings as it has today. Skilled superintendents to take charge of large estates are as impossible to find as are the trained men for scientific investigation. The boy who attends school determined to fit himself for some of the higher callings of an agricultural nature, is reasonably sure to find the opening which will give to him reasonable compensation.

CROP CONDITIONS.

The condition of oats over the oat growing States is reported by the Department of Agriculture as from 10 to 15 per cent better than last year, and, as a rule, three to five per cent better than the ten-year average. Barley also, as a general thing, is much better than last year, the only exception being the "far west," which this year shows a condition of 70 per cent as compared with 78 per cent last year. Spring wheat on the contrary is not, as a rule, in as good condition as that of last year and falls slightly below that of the 10-year average. Winter wheat, on the other hand, from the June 1st report shows some States a 20 per cent better condition than at the same date last year.

FRUIT ON MESQUITE.

The claim by some of our friends on the Colorado desert that fruit can be successfully grafted or budded on the native mesquite, has attracted some attention, but, as a rule, caused a look of incredulity, which makes it appear that many people who have noticed the statement are in the "show me" class. However, the experiment may be easily tried by those who are situated in that section. Meantime, as one paper suggests, "Let us sit tight and say we neither doubt or affirm.

LAND OPEN TO ENTRY.

Thousands of acres of good farming land are to be opened to entry in the Los Angeles district. These lands are located in the forest reserves and will be thrown open under the Homestead Act. The lands are within the counties of San Diego, Riverside, Orange, San Bernardino, Los Angeles, Ventura, Santa Barbara, San Luis Obispo, Kern, Tulare and Inyo. Those desiring to file on these lands must make written applications to Gifford Pinchot, United States Forester, Washington, D. C..

THE INDEX.

Do you file your Cultivator? If not, do so. Those who have will find a fund of information in the volume just completed. This information may be had on short notice, by referring to the index which appears in this issue.

NAMES FOR THE RANCH.

A nice list of names adopted for ranches has been received and is crowded out by the index this week. Next week we will surely give the first installment. Meantime, send on the names.

With 71 beet sugar factories in the United States producing about 400,000 tons of beet sugar, it looks as if it took much sweetening to keep this great republic in a properly sweetened condition, but in addition we have the knowledge that other thousands of tons are imported to make up for our deficiency. California is producing its $10,000,000 worth and now has plans being drawn for the installation of another factory. But these increased facilities for manufacturing this product barely keep in touch with the increased demand. Let us grow more of our own sugar.

Two hundred delegates in session at Santa Cruz at the good roads meeting of the California Promotion Committee, adopted resolutions calling for the introduction and passage at the next Legislature of concurrent resolution providing for the appointment of a joint legislative committee to investigate conditions and outline a plan for a broad scheme of highway improvement. The following is the committee: Chairman, Charles D. Daggett of Los Angeles; L. P. Lowe San Francisco; James H. Gray, Santa Rosa; Geo. W. Pierce, Davis, and Wickham Havens, Oakland.

It is reported there has been some talk amongst the cantaloupe pickers of demanding $4.00 a day besides wages and board, but it is probable such wages will not be granted, because the labor of the best quality is plentiful enough this season that the fruit grower will not consent to any such holdup. If such action is taken it will only be one of the additional incentives to the farmer to work for admission of laborers who will be reasonable in charges for labor at such time of heavy crops.

An Imperial valley paper states that cantaloupe culture has demonstrated one fact conclusively, and that is that it is absolutely essential to get humus into the soil to obtain the best results. There are but a few ranches in Southern California outside of the peat lands where the same statement would not apply. The soil may be immensely rich, but lack of humus prevents the elements of the soil from becoming available to the roots. "With all your getting, get humus."

Fruit growers of the South are finding that the abolition of the strong drink traffic is aiding the fruit growers. That is, the consumption of fruit and fruitades increases as the consumption of intoxicants lessens. This, with the fact that many California grapes will be used in the production of pure unfermented grape juice, may be an item of good news to those growers who are concerned as to the outcome of the present temperance wave which is sweeping the country.

An exchange says it is "no wonder that the Adams Express Company with Senator Platt at its head is opposed to Parcels Post. Besides paying 10 per cent. dividends on $12,000,000 worth of bonds heretofore issued gratis to its stockholders, it cut another juicy melon a few weeks ago that lets in light on its phenomenal earnings. It issued $24,000,000 more bonds, or 200 per cent of its capital stock."

Considerable interest is being manifested in this State in the planting of flax. Some plantings have been made which were fairly profitable and with the advantage that fertility is conserved and land put in better shape for a crop of wheat than if planted to almost any other product. A San Francisco firm is said to be offering to contract for the seed at the rate of $2.20 per hundred pounds on the "pure basis."

Most California fruit growers wish revision which means tariff on our fruits "revised up." It will probably be the reverse unless the growers are prepared to meet the arguments of the Eastern manufacturers, who are well organized and are already opening the campaign to protect themselves.

With residents along the Missouri and Kaw rivers living in the upper stories of their residences because of the good boating below, Californians should be content with the various drawbacks of California climate.

F. C. of San Fernando says: "Enclosed find your dollar for the Cultivator. I consider it a very valuable paper for everyone interested in ranching."

Central California

The Santa Clara valley cherry crop will be a bumper crop.

Field fires near Turlock are reported as doing much damage.

Tulare county is dipping about 300 head of cattle every day.

Packing houses in Visalia are open and working on green fruits.

A new kind of grape is being developed at the Experiment Station at Lodi.

The cannery at Los Gatos is now employing about 150 women and girls.

A short crop is reported for the coming year on the orange trees at Porterville.

A new dam has just been completed at the People's Ditch headgate near Hanford.

County Veterinarian Longey, of Tulare, is making a hot fight against the Texas fever tick.

Some San Joaquin county fruit buyers are endeavoring to buy green peaches on time payments.

Lindsay is some on Valencias as well as navels, having shipped something over 100 cars this year.

Orange growers of Tulare county held a meeting last week discussing the business for the coming year.

The Selma fruit growers formed an association for the purpose of packing and marketing fruits of that section.

Much thinning was done on apricots this year and much of that which was not thinned will be very small in size.

The grain crop on the west side of the San Joaquin valley is proving far heavier than thought possible a few weeks ago.

The frost damage to potatoes on the lower San Joaquin near Stockton, was exceedingly heavy about the first of the month.

Owing to the cool and uniform weather the cherry crop has ripened very satisfactorily this year. At no time has there been a glut.

The Visalia Delta claims the Centerville district has an orange tree which will produce 40 packed boxes. That is going some, sure.

A crop of Muscat grapes near Kingsburg promises good, but it is feared that if the weather should turn warm suddenly some grapes may be burned.

Tulare county fair management is working for a blue ribbon stock sale at the close of the fair this fall. It will be conducted by one of the best auctioneers in the State.

The fruit growers of Hollister held an enthusiastic meeting recently to debate the question of retaining a permanent inspector in that county. Mr. Leonard will be continued.

Fresno apricot growers are somewhat concerned as to the price of dried apricots. There seems to be a lack of inclination on the part of buyers to make extensive purchases.

Mr. Geo. Compere has left for a trip of investigation in European orchards looking after beneficial insects; or in other words, "a bug to eat the bug." He is under direction of State Horticultural Commissioner Jeffrey.

Southern California

Imperial valley is already marketing watermelons.

Rivera Valencias are showing up exceptionally fine.

Imperial valley is shipping out immense numbers of hogs.

Beaumont is selling large quantities of recently subdivided land.

First car of cantaloupes out of Imperial valley netted $2596.50.

Riverside hay crop will be normal. The grain crop is a little shy.

A new date farm has been established by Mr. Bell at Coachella.

Orange county celery planting will not exceed 3000 acres this year.

Ranchers near Santa Ana are complaining of the depredations of quail.

The cherry crop in Yucaipa valley above Redlands has been large this year.

One Highland orange grower reports $800 per acre gross from his ranch.

A Santa Ana farmer sold $1000 worth of green peas off of one acre of land.

Beet sugar factory experts at Santa Ana are drawing plans for the new factory.

Los Angeles has 600 men constantly at work on the great Owens River aqueduct.

Berry pickers at El Modena are having busy times to keep up with the ripening fruit.

The first carload of Coachella onions in Chicago was sold about the first of June.

Salton Sea is said to be drying up at the rate of eig-- inches per month at the present time.

Gifford Pinchot, chief of the Forestry Bureau, will inspect Trabuco and Jacinto forests.

A number of wild Mexican turkeys have been introduced to the San Gabriel national forests.

The walnut crop is said to make the most promising appearance that it has for the past ten years.

Orange county claims she will be one of the large sugar counties in the State, though one of the smallest in area.

Lake Elsinore has been sold by the Temescal Water Company and will now be used for storage of irrigation waters.

People of Orange county are endeavoring to secure the establishment of wild turkeys in the Santa Ana mountains.

Orange county has decided to make no display in the coming State Fair, owing to the lack of funds in the county treasury.

The death of several cattle after dipping for ticks near Santa Ana, has been followed by an investigation by the government officers as to the cause.

Imperial valley papers are appealing to the growers to be more careful in the picking of cantaloupes, many having gone to the market not fully ripened.

California Fruit Growers' Exchange report that the advertising campaign carried on in the State of Iowa has vastly increased the consumption of oranges in that section.

The Coast

Irrigation pumping is increasing in Oregon.

Washington is experimenting in oiled roads.

Fruits in British Columbia give promise for a big crop.

The milking machine is invading the dairies of Eastern Washington.

Union county, Oregon, crop of cherries this year will be exceedingly heavy.

At the recent live stock sale at Portland, Oregon, horses sold for $210.50 apiece.

A heavy rain June 4th did much good to crops at Walla Walla, Washington.

The condenser at Chehalis, Washington, is handling 85,000 pounds of milk daily.

Eighteen combined harvesters have been purchased in Dayton county, Washington.

The demand for alfalfa at Tacoma is keen with present prices prevailing at $14 and $16.

The use of silage amongst the dairymen of the Inland Empire is increasing each year.

Sheep to the value of $1,400,000 were killed in Eastern Oregon by coyotes last year.

The annual meeting of the Inland Threshers' Association was held at Spokane last week.

Kititas wool clip has been completed and the country will market a total of nearly 750 pounds.

Many agriculturists in Oregon are urging the extension of agricultural education in the high schools.

Continued cold weather and much rain have done much damage to farmers near Fairfield, Washington.

The farmers canal near Yuma, Arizona is gradually extending its field, having 3500 acres under cultivation.

Walla Walla, Washington, is suffering from the pest of ground squirrels, which have done immense damage.

The annual round-up of horses in the hills of Chelan, Kittitas, and Yakima counties occurred about the 1st of the month.

The State College at Pullman, Washington, is building a number of large buildings and will more than double its capacity.

The forests of the coast region of British Columbia will be protected this summer more completely than ever before by a large number of wardens just employed.

The Wenatchee forestry office has received many applications for permission to run sheep on the forest reserves, and many bands are already on the way to the reserve.

Oregon recently made one shipment of 1500 live chickens to Fairbanks, Alaska. Three tons of grain were shipped with them to keep them in food until arrival.

Vandals destroyed 10,000 crates of strawberries valued at $30,000 belonging to growers who are members of the Farmers' Irrigation Company of Hood River, Oregon. The destruction was caused by blowing up the flumes conducting water to the fields of the owners. Detectives are looking for the culprit.

Coulson's Cresolene

LICE KILLER
DISINFECTANT
AND DIP

Dilute With Water Before Using

CRESOLENE is a powerful disinfectant, insecticide, and germicide obtained from coal tar. It is non-poisonous, and non-corrosive and will do no harm to the most delicate skin.

It mixes readily with water, forming a milky emulsion, and can be diluted from 50 to 100 times it own bulk, in accordance with the different uses to which it is put.

Thus when you purchase 1 gallon of CRESOLENE you can make up to 100 gallons of the best disinfectant for use with stock, poultry, dogs or as a general disinfectant and insecticide.

This reduces the cost to 1 1-4 cents per gallon which is cheaper than anything else on the market.

PRICES: Quart can, 50c; one-half gallon, 85c; gallon, $1.25.
Freight paid on orders of one gallon or more.
Manufactured by

Coulson Poultry and Stock Food Company

Profit in the Poultry Yar

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed management, disease and its prevention will be answered through these columns

PROFIT FROM SMALL FLOCKS.

SMALL flocks almost invariably give better returns per hen than large flocks, and this fact has led many a man and woman to embark in the poultry business on a large scale to their final sorrow. These people have figured that if they can net $2.00 per hen with a flock of a dozen hens, they can secure similar returns from a thousand.

It may be possible, but very few have realized it. In tending a small flock but little time is required, and that is gladly given as it is largely in the form of recreation. On the other hand, a thousand hens require one man's attention for the entire day. It becomes drudging and many little things are neglected that tended to make the small flock a success. Again, the question of feed enters as a factor. The few hens are fed largely on what would otherwise be waste. The large flock must be provided for out of the bank account. Very many families, both in city and country, can keep a few hens that will provide fresh eggs and many a good chicken dinner at a very small cost, while very few of these people could make the business pay on a large scale.

What One Small Flock Did.

In the autumn of 1905 I had occasion to select a flock of fifteen pullets for experimental purposes. They were White Leghorns hatched in the preceeding March from eggs bought of a neighboring farmer. In September they were placed in a small yard six feet wide and twelve feet long, two feet high and covered with wire. They had a small house three feet wide and six feet long. They remained in this pen until September, 1906, with the following results:

They laid during the year 1577 eggs or approximately 109 eggs each. These eggs were sold for $32.55. The average price was good, as many of the eggs were laid during the period of high prices. Each hen ate seventy pounds of a well-balanced ration; the cost of food was one dollar, leaving one dollar and twenty-five cents profit per hen. This illustrates what may be done in the back yard with a small flock of hens and at small outlay. In the case of most families the cost of feeding the flock would be much less, as they would consume table waste of small value.

POULTRY BREVITIES.

Examine your chicks for head lice.

* * *

Better a dozen well bred birds than a hundred scrubs.

* * *

Young turkeys cannot endure the hot sun, and many are lost for want of shade.

* * *

Chicks of different ages should not be fed together. The smaller ones will be crowded from the grain and will not thrive.

* * *

Don't fail to provide grit for your fowls if confined, and it is equally essential if the soil on which they range is adobe.

* * *

Don't sell small eggs; while it is possible that they may be as fertile and produce as many chicks as larger eggs, it is probable that pullets from such eggs will lay sn eggs.

* * *

Early hatched cockerels bring highest broiler prices. The ea hatched pullets are the most profita as egg producers. There is a disp tion with many poultry writers overestimate the profits of the po try business, consequently peo often start in the business with n taken ideas as to the possible turns.

* * *

Whitewash.

I would like information thro the columns of the poultry d ment of the Cultivator as to the method of preparing a whi adapted to use in the poultry and that will be durable. Wh have used flakes off badly. Is wh wash a good disinfectant? —E. G

The Government Whitewash made in the following manner: H a bushel, 16 quarts, of fresh lim slaked with warm water; cover du the process to keep the steam; st the liquid through a strainer-chee cloth, or gunny sack will do. eight quarts of salt previously solved in warm water, three po of ground rice boiled to a thin and stirred in boiling hot. Add pound of powdered Plaster of P and a pound of glue, which has previously dissolved over a slow Then add five gallons of hot wa the mixture. Stir well and let for a few days. Cover up from It should be put on hot. One pin the mixture will cover a square if put on properly; small brushes best. There is nothing that comp with it for outside or inside work, it retains its brilliancy for years. oring may be put into it and make any shade desired. It is good chicken houses to fill small cracks makes a smootth surface. W wash has not much disinfecting p but the above may be made a disinfectant by adding to the mix two pints of carbolic acid.—S. S

* * *

Can you tell me what is the of the excessive growth of wing my young chickens? I have a one hundred Leghorns, five weeks hatched in an incubator and largely on chick food. Their w in many cases, are so long that drag on the ground.—E. C. C.

Overdeveloped wings indicate the chickens have received a chec body growth, due to possibly w vitality, inherited from the parent to food and feeding. But I believe more common cause is faulty te ature in the brooders. Too cold badly ventilated brooders are res sible for much mortality among c ens. It is a law of animal dev ment that the bill, feet and wings tinue to grow when their g growth has been checked.—S. S

FEEDING LITTLE TURKEYS

We never feed young turkey til they are twenty-four to forty hours old, then we give them s small amount it can scarcely be ca a feed. One thing we must alw remember is not to overfeed the for they are very greedy little fello and if allowed all they could eat wo soon die.

We throw some fine grit or oys shells in the pen as soon as we the turkeys in. They will pick this while the old turkey is eating a liberal meal of shelled corn. Our first feed for the little ones is stale bread wet up with milk and squeezed dry; for this we always use whole sweet milk. If we have no stale bread on hand we give cottage cheese made by putting thick sour milk on the stove until the curd sets then turning it into a cheesecloth sack and letting it drain until it is very dry. Enough can be made at one time to last one or two days.

This cheese is the chief feed for the poults until they are about three or four weeks old; then we commence to give nice sweet cornmeal; do not use it if the least bit sour. We mix the meal into a stiff dough using sweet milk. We also have used shorts in the same way with good results. We feed our little turkeys while they are in the pen about every two hours. We give plenty of fresh water at all times in perfectly clean dishes. Milk, we consider a very fine feed for our turkeys all through the summer months. We also give it to the breeders in the breeding season. We use creamery milk exclusively, both for curd and for drink.

After the poults get large enough to stay in the field all day we give a small feed in the morning with fresh water in their trough, then we do not feed again until they are put in the park for the night, when they all get full feed with milk and water to drink. As they grow older we add wheat to their bill of fare. We have used the prepared chick feed offered in market but after a trial of several kinds we like our own mixture of curd and cornmeal best, as the little fellows seem to do best on these and grow faster.

If we wish them for breeders we feed very sparingly on corn until the weather begins to get quite cold. Barley we consider very poor feed for turkeys if given oftener than three or four times a week and then only in small quantities. We have learned that barley fed to our flock of turkeys in the fall after threshing will kill them; that is, if fed exclusively, as it is often fed to cockerels to fatten them while they are on the range.

DOCTORING SICK FOWLS.

A writer in Farmers' Tribune speaking of doctoring sick fowls, says:

Some poultry raisers advise the hatchet remedy at once if a fowl is sick, claiming that it does not pay to fuss with them, but I know of several instances where it has paid, one of which I will relate. We once had a case that for a day or two puzzled our "family physcian," and came near being fatal. It was noticed that one of the fowls, a nice pullet, went about with her mouth open, every little while shaking her head and making a queer gutteral noise. When feed was offered her she would try to eat but could not pick it up. As she was a fine Plymouth Rock we disliked to kill her. One morning my husband decided he would take her to the barn away from the rest of the flock as the disease might be contagious.

I opened her bill so as to look down her throat, when I discovered the cause of her trouble. In the hen house there was a block of wood on which we pounded bones for the poultry. She had got hold of a pointed piece, which, in an attempt to swallow, had lodged in her throat. The splinter was removed and the pullet soon took her food and retained her place in the flock instead of being banished on account of infectious disease or receiving the hatchet treatment.

Some years ago we had a flock of 50 hens which were furnishing us with a fine supply of eggs. On going to feed them one morning 26 were found dead. The trouble was pronounced cholera, but it was a source of wonder to us that they should be taken at the same time and die so suddenly. They were taken from the coop and buried, then we began to investigate and soon found the cause of the trouble. Some brine had been emptied on a manure pile the day before, thinking to put it where it would do no harm. The hens had worked in this, picking out bits of salt, then had gone to roost and gone over night without water, and the result was that fatal epidemc we called cholera. No matter what ails a fowl now, we want to know the cause of the trouble and an examination has to be made forthwith.

FEEDING CHICKS.

Professor C. K. Graham, of the Conneticut Experiment Station, finds the following mixture giving good results when fed to young chickens: Cornmeal, 35 per cent; ground oats, 30 per cent; low grade flour, 25 per cent; bran, ten per cent. It is mixed with skim milk to a soft dough and fed as much as will be eaten up quickly. When skim milk is not available beef scraps and water are used, but with less satisfactory results. To get a good grade of oat feed, Prof. Graham finds it desirable to buy whole oats and take them to the mill to be ground, thus avoiding the excess of hulls which are found in most of the purchased foods. This food is excellent in finishing chickens for market giving a fine texture to the flesh desirable for a choice, private trade where the object is to produce the most weight without regard to quality of flesh, he considers it doubtful whether any grain will give results equal to whole corn.

WHITEWASH THE HEN HOUSE.

Every poultry man should give the hen house a periodical coat of limewash, and the oftener he does it the better. The matter is a very simple one. If the house is small, all you may want is a whitewash brush, and a bucket of water into which a few handfuls of quicklime have been put, well stirred together, and allowed to settle. The stuff when put on should be about as thick as cream. A handful of common rough salt will help it to adhere to the walls, a spoonful or two of liquid carbolic will help it to do its murderous work on animal life, and a little bit of powder-blue (washing blue) will prevent the white coat turning yellow by and by.

If the hen house is a large one it will pay to use a sprayer for putting on the limewash. This is a most effective way of whitewashing any building.

When a hen has quit laying it is enough to cause her to loose her head over it.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Takes Issue.

In the issue of June 11 Mr. A. R. Briggs gives his second article on "Sulphuring Fruit and the Pure Food Law," which is not satisfactory to me nor I can say to others. An effort, seems to me, is being made to cover up the questionable methods of the packers, commencing with that part of the article, "The dried product goes then to the packer," and "In the packing house before it is put in boxes for distribution to the trade." "The fruit is again sulphured," etc. This article is evidently written in the interest of the packer. Any one acquainted with sulphuring and drying of fruit knows a resulphuring of fruit is a damaging process. This resulphuring has led to considerable criticism, chiefly from persons not familiar with the requirements of the trade.

Good Lord forgive us. The packers are an immaculate set. Heaven protect them. Don't let the trade requirements dissipate their "honest endeavors," for it might necessitate a resulphuring of their whole plant, animate and inanimate! I have been drying apricots for 35 years and claim to know something about the business. I think the hue and cry about sulphured fruit has been brought about by "the requirements of the trade," or getting all the trade we bear.—J. Hobart, Nordhoff.

We do not think Mr. Briggs is influenced by "trade requirements," other than as they affect the grower. However, that "resulphuring" has resulted in many abuses goes without saying.

Carbon Bisulphide.

In your issue of May 7 is a short article on the use of carbon of bisulphide to kill worms on peach trees. Is there any danger of hurting the young trees by applying too much or too close, or should liquid come in contact with wood or bark? Is wrapping the stems of trees with paper a preventative of worms?—Subscriber, Simone.

If bisulphide of carbon comes in contact with the roots while it is in the liquid form it will kill the trees. It should be applied in such quantities to the surface of the ground that it will not soak to the depth of the roots, but must reach the roots in the form of a vapor. We would not recommend applying it to the wood of the trees so that it will come in contact with the bark. If it is to be used for borers in the branches or trunks, inject the liquid into the worm hole with a small syringe in quantities that will enter without overflowing. If the burrow takes an upward course the bisulphide will not do good, as the gas is heavy and flows downward. Wrapping or painting with whitewash will prevent borers from entering. The borer only attacks trees or branches that are injured by the sun.

Mal-di-Goma.

Will you be so kind as to let me know through the Cultivator what is the best treatment to prevent root rot on orange trees, and if there is any way to cure a tree after it is affected by this disease? I have noticed several places here and elsewhere, where the trees are suffering on acount of this cursed root rot, and it is hard to discover until the tree fades, which makes it very hard on the grower. I would like to hear from you in regard to it, and also from some of the able writers in your great paper.—C. E. J., Anaheim.

We assume that you refer to the foot-rot. It is doubtful if an orange tree ever wholly recovers from a severe attack of this dread disease. The preventive for this is to keep the surface of the ground at the base of the tree in a dry and friable condition. It is in most cases brought on by an unhealthy condition of the soil in conjunction with too much water at that point, and especially in hot weather. It has been traced directly to the combination of stable manure and water at the base, under conditions that produced some sort of fermentation in the soil. The best treatment is to remove the soil and cut out the diseased bark and apply some sort of cleansing wash. Diluted crude carbolic acid is generally used. Paint the wound with some sort of cheap wax and cover with fresh soil that is barely moist.

Tree Supports.

Can you tell me where I can get the wire limb supports?—J. H., Nordhoff.

Address J. K. Woodward, Riverside, or R. M. Teague, San Dimas.

Malthoid Roofing

Mr. H. B. Eakins, of the Commercial Warehouse Co., Los Angeles, Cal., U. S. A., writes: "Now that we have had two good rains to test our Malthoid roof, we have desire to express our satisfaction in the knowledge that we have a covering over our head that does not leak. We write you regarding our pleasure in this matter from the fact that we had fully expected more or less trouble, as we did not believe it possible that so large a roof surface could be covered with any material and stand the test of a first rain, but there was not a leak due to defective roofing."

The Paraffine Paint Co. San Francisco California

E. G. Judah, General Representative, Security Bldg, Los Angeles

Bitter Milk.

I have a cow, farrow, 3½ years since she was fresh, but yet giving us abundant milk for our purpose. Milk is usually sweet, but at times, after standing 6 to 12 hours, will become exceedingly bitter. Is this caused by fact that she is farrow? And is there any remedy?—J. C. O.

Usually the fault of keeping milk at wrong temperature—when chilled enough will keep all right. If temperature was higher would sour, naturally, by lactic acid bacteria. Wash-scald everything well and then try keeping the milk either colder or warmer. This bitter bacteria comes from spores that are hard to destroy. —M. E. S.

Leg Weakness.

I believe if "Subscriber" of San Jacinto and "H" of Modesto will kill some of those afflicted pigs and make a thorough examination they will find either kidney or measles worms the cause of the trouble. If either of them tries Dr. Whiting's remedy, wish they would let readers of Cultivator know with what success.—M. C. Burnett, Fallbrook.

Sauer Kraut.

Will you please give me a recipe for sauer kraut? Will it keep well made this time of the year?—M. A. V., Bonsall.

See issue of Cultivator of Feb. 27, page 229, or that of April 2, page 389. On these pages are three good recipes.

Rust.

My logan and blackberry vines are affected with rust and the vines keep dying off. Can you recommend a spray for this and if so state at what time it is best to use it.—J. W. A.

There is no remedy of much value at this season. When fruit is off cut out all old canes and burn. Spray with weak Bordeaux, say of strength of 3-3-50, then in winter spray with 5-5-50 formula.

Veterinary

Dr. R. T. Whittlesey, veterinarian, of 714 East Seventh street, Los Angeles, will answer questions in this department. In writing of sickness or injury to any animal be explicit in giving symptoms and particulars. Always enclose full name and address, but if assumed name or initials are preferred they will be used.

If an immediate mail reply is wished enclose $1.00 for such service, but for replies in paper only, no charge is made if the answer will be of general interest.

Sore on Leg.

Kindly tell me through the Cultivator what to do for sores on a donkey's legs. Every summer sores break out on the forelegs, mostly on the joints. They seem to itch, as he bites them. We have used several salves and have healed some, but it has taken a long time, except one, which we cannot heal. It has grown to be as large as a dollar and seems to be swollen. Sometimes it runs matter. The flies bother it a great deal, no matter what we put on it. He is fed good hay.—A. F.

Use the following: Formalin, 2 oz., water, one gallon. Saturate cotton and bandage it over sore. Leave two days and repeat the dressing.

Possibly Tuberculosis.

I have a sick cow and cannot find out what is the matter so do not know how to treat her. Have consulted several veterinarians, and they do not know what the matter is. She is one among several that are affected; all affected cattle have been in the same pasture. Cow about eight years old; last calf five months old. When taken sick was in good condition. She strains as if trying to urinate, but passes very little water at time; eyes about half closed, is dull, phlegmatic and very weak; appetite good, eats heartily, but loses flesh all the time. Some of the affected cows had difficulty in breathing. No young stock affected. Several have died. One was dissected and the only clue to trouble was that the bladder was a little full but not to any great extent.—J. S. C., Watsonville.

Have them tested for tuberculosis by a competent veterinarian and let us know the result.

Aphis.

Enclosed please find sample of orange leaf which seems to be affected with some kind of disease. Will you please tell me through the columns of your paper what the disease is and a remedy to prevent its spreading.—A Subscriber, Woodland.

The orange leaves sent have been infested with aphids, but these have all been parasitized with a Braconid fly, which has reduced them to a state of harmlessness. Aphids cluster in colonies and sometimes form great masses, but they have a natural enemy in the little Braconids, internal parasites, which deposit an egg in each aphis, and this hatching out into a minute grub, ends the career of the particular aphid attacked. As the internal parasite attains maturity the aphid swells into spherical shape and at last the internal insect cuts a round hole in the upper part of the now empty and swollen skin of his host and escapes leaving the bloated skin of his former host behind. These orange leaves have been infested with aphids, but all have been parasitized and there is nothing but the empty skins left, these have been somewhat crushed out of shape. Our correspondent need have no fear from this source, and if all his insect enemies were in like condition he would be fortunate.

HOW TO KEEP WATER COLD.

"Having tried it, I recommend the following mode of keeping ice water for a long time in a common pitcher," says a writer in Woman's Home Companion for July. "Place between two sheets of thick brown paper a layer of cotton batting about half an inch in thickness; fasten the ends of the paper and batting together, forming a circle, then sew or paste a crown over one end, making a box the shape of a stovepipe hat minus the rim. Place this over an ordinary pitcher filled with ice water, making it deep enough to rest on the table so as to exclude the air, and you will be astonished to see the length of time that the ice will keep and the water remain cold after all the ice has melted."

DIVIDEND NOTICE.

San Francisco Savings Union.
N. W. Cor. California and Montgomery streets.

For the half year ending June 30th, 1908, a dividend has been declared at the rates per annum of four and one-quarter (4¼) per cent on term deposits and four (4) per cent on ordinary deposits, free of taxes, payable on and after Wednesday, July 1st, 1908.

Depositors are entitled to draw their dividends at any time during the succeeding half year. A dividend not drawn will be added to the deposit account, become a part thereof and earn dividend from July 1st.

LOVELL WHITE, Cashier.

DIVIDEND NOTICE.

For the half year ending June 30, 1908, a dividend has been declared at the rate of 4 per cent per annum on all deposits, free of taxes, payable on and after Wednesday, July 1, 1908. Dividends not called for are added to and bear the same rate of interest as the principal from July 1, 1908.

WM. A. BOSTON, Cashier.

rrigation and Forestry

FEW POINTERS ON IRRIGATION.

ALMOST the total expense of preparing for irrigation is due to construction of field laterals d furrows. In those cases, including rhaps the majority, where the mak- of the furrow serves also as a cul- ation, the cost of making them ould not be charged wholly against preparation of the ground for irri- tion. The distance apart of the lat- ls in the field depends chiefly upon ich of the methods of irrigation is be employed. It depends also to me extent upon the character of the l in respect to its capacity for the pid absorption of water, and upon lay of the land.

For flooding, the laterals are placed m 100 to 300 feet apart. The eater distance obtains on wild hay d and the lesser in the irrigation of alfa and small grain growing on ls which take the water readily. average distance apart of laterals cultivated fields which are to be ir- ated by flooding is 125 to 150 feet. eder laterals for furrow irrigation placed at greater intervals, rang- ordinarily from 300 to 1200 feet, cording to the lay of the ground and carrying capacity of the furrows. ere is a general tendency to build erals closer together, as it is found at the water is more easily and ef- tively handled in this way.

The field laterals are very generally ade about one foot wide on the bot- m, one foot deep, and from four to feet wide on top. The grade, of urse, varies to some degree with the y of the land, but a fall of five feet the mile is common and is quite nerally recognized as a minimum low which it is not desirable to go. e common stirring plow, the lister, e wooden V, and the reversible ade machine are all used for the con- ruction of laterals and approved by perienced irrigators. The blade ma- ine is considered better than the V clay or rocky ground. The reversi- e machine requires about twice the rce of men and horses to work it at the V does, but when used sys- matically the work can probably be ne at somewhat less cost than with e V.

A superintendent of large experience timates that two men and two ams with a V can complete from one three miles of field laterals a day, pending on the condition of the ound. For irrigation by flooding is would be sufficient for the irriga- on of from twenty to sixty acres. llowing $6 a day for men and teams, e cost for an acre would be from n to twenty cents. For turning the ater out of the field laterals all of e better known devices are in se such as canvas dams, sheet-iron ams and dirt checks. The sheet- on dam is especially satisfactory in laces where digging is undesirable, in fields of alfalfa or of small grain, nce it can be set and removed with- ut the use of the shovel.

In flooding, the laterals are dammed nd opened at intervals ordinarily oming within the range of from fifty 100 feet. For furrow irrigation of eneral field crops the furrows are us- ally made with a plow or lister when rge furrows are required. A disk ultivator makes a good furrrow for atering corn and potatoes. When he earth must not be thrown against he plants, as in the case of beets or ines, a smaller appliance known as n irrigating shovel is attached to the ultivator and makes a neat furrow.— ield and Farm.

SOAP TREES.

Consul-General Richard Guenther makes the following report from Frankfort. Germany:

"Mr. R. Lang. of this city, councilor of commerce and delegate to the Government of Algiers, states that he has just returned from a commercial tour of study in Algiers, where he was called by that government. During his trips he met one of the largest landed proprietors, Mr. S. Bertrand, chairman of the Algerian Agricultural Society, at L'Arba, near Algiers, whose domain comprises many thousand hectares (hectare, 2471 acres.) which are planted with vines, oranges, olive and soap trees. He has succeeded, after numerous experiments, in cultivating a large plantation of soap trees, from which he gathers several thousand tons of berries annually. The soap tree resembles an apple tree of medium growth. The fresh fruit is green, the interior of which, besides the kernel, contains a yellowish gelatinous, sticky substance. The fruit, used for making soap, contains three times as much soap as the 'panama' wood. It seems to be destined to be of great service to the cloth and linen manufacturers, and above all, for domestic purposes, as it can be used to clean linen and silken fabrics and colored embroideries.

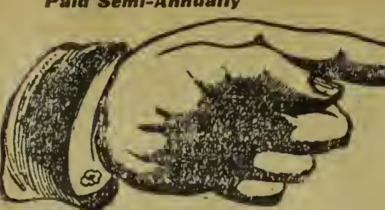
The almost world-wide movement to protect and establish forests has reached China, and the first Chinese school of forestry will shortly be opened at Mukden, according to a recent report by Consul-General H. W. Ragsdale, at Tientsin. The Chinese empire is usually pointed out as the worst example, among modern nations, of forest destruction. The floods which are periodically poured down from the denuded mountains are destructive beyond comparison with any other country, and the want of forests is assigned as the chief cause. Wood is scarcer in China than in almost any other region in the world, although the country is well adapted to the growing of trees. In the establishment of a forest school the Chinese government gives evidence that it realizes the need of beginning its reforestation in a scientific manner.

FOR PRACTICAL FORESTRY.

A gift of two thousand acres of forest land in Massachusetts to Harvard University by a number of Massachusetts citzens is one of the most acceptable gifts that a great universty could receive at the present time. The nation has adopted a comprehensive forest policy and most of the States have enacted forestry laws. The American people have awakened to the fact that there is peril in the wholesale destruction of the forests that has been going on unchecked, and statesmen keenly realize the necessity for adopting the regulations and methods that obtain in European countries for the preservation and restoration of the forest growth.

Forestry has assumed in this country the importance of a science, and we look to the universities to turn out trained men to apply that science for the benefit of the country. The forest tract presented to Harvard will be well adapted to practical trainng in all branches of forestry, and its treatment will make a valuable object lesson for owners of woodland.

Paid Semi-Annually



7% Assured Profit

We offer you Cane Sugar Lands in Mexico. Perfect title. Give 50-year contract to cultivate for you, guaranteeing 7%, paid semi-annually, until crop profit exceeds this amount. Offer these lands for cash or on easy terms.

A Life Income from Land

Sugar Plantations produce the greatest continuous yield of any known crop. Tropical Mexico stands today unmatched in soil, climate, water. We own over 9000 acres in the heart of the best section—near Tampico. You become a land-owning profit-sharer in this project. We do all the work for you.

Sugar Plantations the Most Profitable Crop in All the World

One Acre Should Produce $203.52 Annually
Five Acres Should Produce $1017.60 Annually
Ten Acres Should Produce $2035.20 Annually

A Splendid Ranch Bargain

44 acres black loam mixed with lime rock gravel, in the head of the Nipomo Valley, rich warm friable soil that is hard to beat anywhere. Has 6-room hard-finished house, very convenient, large barn, good out buildings, about 5 acres orchard, apples, almonds, apricots, figs, pears, peaches, plums, prunes, quince, nectarines. Also grapes, currants, gooseberries, blackberries, loganberries, raspberries and dewberries. All these fruits do fine, and there would be big money in extensive planting of currants and gooseberries, as they do exceptionally well, and the market is first class. The place is 2 miles from Nipomo on splendid road, and is a grand buy at $4750.00.
We also have a fine buy in a completely equipped and well stocked 15-acre poultry ranch at $3500.00, including everything on the place, even the house furnishings.

S—Spare the Mole, 72; Strawberries,

The "TUBULAR" Has a Marvelous Advantage over Others.

In reference to this picture comparison of separator bowls the manager of a prominent agricultural publication recently wrote us:—

"It seems to me that this is the most emphatic way of showing the vital features of your Tubular Separator that I have ever seen. As I look upon the matter the bowl or what is in it practically does the whole of the work, so it is easily apparent that the Tubular has a marvelous advantage over others."

Only one thing better for a dairyman to see and study than this comparison of bowl parts, and contents, and weights.

That's the Tubular itself, in his own dairy.

We have been building separators, at our West Chester factory, for 28 years. We know them all and what the different bowls can do—on paper and in the dairy.

The quoted comment is absolutely true. The Tubular will prove it in your dairy. Our guarantee makes every purchaser safe—in buying today, and in using for a life time.

Let us show you the marvelous advantages the Tubular has over other separators. Write for Catalogue No.260

THE SHARPLES SEPARATOR COMPANY,
West Chester, Penna.
Toronto, Can. San Francisco, Calif. Chicago, Ill.

Great Year for, 120; Sweet Potato Culture, 178; Strawberries, to Grow, 194; Shipping Vegetables, 258; Spraying the Garden, 386; Strawberry Fertilizer, 418; Strawberries for Market, 480; Seed Bed, 577; Sweet Herb Garden, 696.

THE HARD WORKING FARM WAGON.

It should not require argument to convince any one that it is economy to buy a good wagon. It is in use almost every day in the year. It has to endure all kinds of treatment, carry all kinds of loads, often over roads and through sloughs and along hillsides which should be considered impassable, and is necessarily exposed to all kinds of weather. The wagon is expected to stand all this, and to be found doing duty after a long term of years. It is a trying service. Naturally only the wagons that are built with scrupulous honesty are equal to the duty.

Among the wagons that have proved their worth and given long, satisfactory service, is the line manufactured by the International Harvester Company. These are: The Weber, the Columbus and the New Bettendorf. Each of these wagons is of proven quality—standing up year after year under the most trying tests that wagons are ever subjected to.

The new Bettendorf differs from the Columbus and Weber in that the front and rear gears are made of steel. This adapts it to use in any climate. There can be no swelling or shrinking and drying apart, and it is a wagon that can be relied upon to carry any load the average farmer has occasion to haul.

These several makes of wagons are sold by different International local dealers. Booklets and all particulars may be had from them or correspondence direct with the main office at Chicago will receive prompt attention.

Classified Liners

Rates 1½ cents per word per issue. No ad accepted for less than 25 cents. Our classified columns are the clearing house for the readers of the Cultivator. Here you can insert an ad for the small sum of 1½ cents per word per issue, and be sure that it will be read by thousands.

LIFE IS WHAT YOU MAKE IT.

To the preacher life's a sermon,
To the joker it's a jest;
To the miser life is money,
To the loafer life is rest.

To the lawyer life's a trial,
To the poet life's a song;
To the doctor life's a patient
That needs treatment right along.

To the soldier life's a battle,
To the teacher life's a school;
Life's a "good thing" to the grafter,
It's a failure to the fool.

To the man upon the engine
Life's a long and heavy grade;
It's a gamble to the gambler,
To the merchant life is trade.

Life's a picture to the artist,
To the rascal life's a fraud;
Life perhaps is but a burden
To the man beneath the hod.

Life is lovely to the lover,
To the player life is play;
Life may be a load of trouble
To the man upon the dray.

Life is but a long vacation
To the man who loves his work;
Life's an everlasting effort
To shun duty to the shirk.

To the heaven blest romancer
Life's a story ever new;
Life is what we try to make it—
Brother, what is life to you?

—S. E. Kiser.

THE STORY OF A CAMERA THAT LIED.

THE man from Goshen, Ind., was aboard with a grouch. "I'd like to know what this world's a-comin' to, anyhow," he grumbled. "It's got so you can't believe anybody. There ain't any such thing as honesty and honor nowadays. Used to be you could trust some people, but you can't do it now."

"Oh, I don't know," said the red-headed man in the corner. "I guess we're no worse than our ancestors. There was a fellow named Solomon who declared that all men are liars. And that was some time back."

"Yes, but they were just plain liars then," insisted the grouch. "They didn't have the arts and sciences to help 'em make their lies look so much like the truth you couldn't tell 'em apart. Solomon's liars were all in the kindergarten class. They were just beginnin' to get ready to commence to be liars. If a bunch of 'em could drop in here now they'd be so honest by comparison we'd have to chase 'em right out again."

"Well," said the passenger from San Francisco, "I wouldn't go so far as to say that there is no such thing as truth in the world, but our friend here is right in saying that the aids to falsehood are growing more numerous and more cunning every day. Take photography, for instance. Only a few years ago it was an accepted axiom that the camera could not lie. Now just look at it. Of all the unprincipled, mendacious, absolutely soulless liars on the face of the earth the camera is the worst. Why, only the other day I saw some photographs of polar bears strolling down Fleet street, in London, a hippopotamus sporting around the piers of the Tower bridge in the Thames, and lions taking an afternoon nap in the ruins of St. Paul's Cathedral. Another photograph showed an automobile jumping a fence in a fox chase. Wouldn't that make Solomon open his eyes?"

"It sure would," answered the moon-faced traveler from Toledo, "but he'd 'a' shut 'em again if he'd seen the camera lie I got mixed up in not long ago."

"How was that?" inquired the red-headed man in the corner.

"It's a family affair," began the Toledo traveler, "and a rather delicate subject, but I won't name any names, at least no real names, so the tellin' of it won't do anybody any harm, and it will illustrate this camera business. I've got a very particular friend I'll call Jones, because it's a simple name, easy to remember and doesn't belong to him. He's one of the best fellows in the world, square as they make 'em, and although he's been married fourteen years he still thinks his wife is the only one. I butted into Jones' private office one day not long ago without knockin', bein' a privileged character, and found him stalkin' up an' down the room, runnin' his fingers through his hair, grittin' his teeth and mutterin' to himself like the villian in a melodrama. He didn't notice me for a minute or two, just kept up his walkin' stunt as if he had a bet on, until I slapped him on the shoulder.

"'What's the matter, old man,' I says; 'don't your feet fit you?'

"Then he stopped and glared at me, and clutched his hands like he didn't know whether to take a strangle hold or a knockout. His face was so red it was nearly purple, and his breath was whistling out through his teeth like the exhaust of a worn-out steam engine. Honestly, I was scared, and I was figurin' on whether to call for a doctor or a policeman when he dropped into a chair and covered his face with his hands.

"'There, there, old chap,' I says; 'you'll be all right in a minute. What's up, anyhow?'

"'Bill,' he says, after a while, when he got his bellows under control; 'Bill,' he says, 'you're my friend. I wouldn't say anything about it to another man on earth, but I can trust you, Bill. Just look at that.'

"He picked up a photograph from his desk and handed it to me."

"'That came to me in the last mail,' he said. 'There was nothing to indicate who sent it.'

"The photograph was a large one, about twice the size of a cabinet. It was a picture of a man and a woman, standing, the man with his arm around the woman's waist, the woman with her head on the man's shoulder. Both, judging from the expressions on their faces, seemed to be pretty well pleased with themselves. The woman was Jones' wife. The man was not Jones."

"It knocked me silly, I can tell you. If it had been an anonymous letter you could have pooh-poohed it. But this was the goods. There wasn't any answer to it. And I couldn't open my mouth."

"'Well,' he said, after a bit, 'don't stand there like a dummy. It ain't your funeral. What do you think about it?'"

"'I can't think, Tom,' I says. 'I can't believe it. It isn't possible.'

"'Oh, cut that out,' he says. 'The evidence is conclusive. The question is, who is the man?'

"'What, don't you know him?' I cried.

"'No. Do you?'

"'Yes,' I answered, 'and that makes it all the harder to understand, Tom. He's a friend of mine, or was! not as close as you, Tom, but a good friend, and I never would have believed him to be one o' that sort. Unless he's got a double, Tom, that's Jack Smith.'

"'Very well,' says Jones, shutting his teeth hard and reaching into his desk for a revolver. 'Very well; I'll go over and call on Mr. Smith right now.'

"'Now, look here, Tom,' says I. 'That sort o' business won't do. If things have got as far as it looks, you're not goin' to help matters by makin' 'em worse. You've got some children, you know. You're goin' to remember them, and you're goin' to protect them from scandal, or you're no friend of mine, Tom,' I says. 'Besides, Tom,' I says, 'I feel it in my bones that there's some shenanegan about this. I don't know how it can be, but there's not goin' to be any rough house over this business if I can help it, Tom, until we go to the bottom of it, at least."

"Well, I talked to him like a Dutch uncle for half an hour before I got him to put up his gun and go with me to see Smith. Smith was in his office, and without any howdy-dos or introductions I put it up to him straight.

"Jack,' I says, 'look at this photograph.'

"Well, sir, you ought to have seen that man's eyes stick out.

"'For God's sake, Bill,' he cried, 'where did you get that?"

"'That ain't the point, Jack,' says I. 'The question is, is that you?'

"'It's me or my image,' he says; 'but as sure as there's a God in heaven, Bill, I never stood for this picture, and I never saw this woman in my life.'

"'Do you mean to say, sir,' broke in Jones, shakin' his finger in Smith's face, 'th at you never had this photograph taken with my wife?'

"'Now, see here, sir,' said Smith, backin' up. 'I don't permit any man to come at me like that. You've heard what I said. That's straight. I don't repeat.'

"Tom turned to me, shakin' like a leaf and as white as a sheet. He was all gone to pieces, yet it was as plain to him as it was to me that Smith was telling the truth.

"'Jack,' I says 'come down off your high horse. This is Tom Jones, the best friend I've got in the world, not even exceptin' you. You're a married man and ought to understand how he feels about it.'

"That was enough for Jack. He held out his hand.

"'Mr. Jones,' he says, 'I beg your pardon. That is my picture, but it is not me. I don't understand it, but if your wife is as innocent of any conscious connection with that photograph as I am, you've got nothing to worry about. And if I'm innocent, the chances are a thousand to one that she is.'

"Tom looked at Smith for a minute and then took his hand and shook it like he was workin' a pump handle.

"'I believe you,' he says. 'I can't see the way out, but maybe there is a way. Maybe there's a trick.'

"'There must be,' says Jack, 'and it's the devil's own. I'm mixed up in this thing now, and we're going to see it through together. I have a right to know the truth.'

"That's it, exactly,' says I. 'And let's get busy.'

"Jack picked up the photograph and looked at it closely for several minutes.

"'I begin to see a light,' says he, after a bit, 'but it doesn't help me to understand it. I never had a suit of clothes like that. I never had a tch chain or charm like that. I ı't wear a ring.'

'Let me have it, quick!' cried ıes. 'I see! I see!' he gasped, rung over with excitement. 'I didn't k at anything but the face before. ıt isn't my wife's form; it's too ge. She has no dress like that—'er did have. Look at that brace- Bill. It isn't hers. But it's her e. There never was another face that, Bill.'

It's her, and it isn't; it's Jack, and sn't,' says I. 'Now, where are we I am worse puzzled than ever.'

So'm I, so'm I,' says Jones; 'but a trick, it's a trick, Bill. My 's all right. That's the main thing. sure of it now.'

'Good!' cries Jack, then he turns me.

'Bill,' he says, 'do you happen to ɔw a photographer you can trust?'

'Sure,' says I. 'There's one across street that's as safe as a burglarof.'

Well, phone for him to come over.' In three minutes we had the photopher in that office. In two minutes re, with the aid of a pocket microspe, the mystery was solved. nebody had got hold of a photoph of a man and a woman in a lov- attitude. Then they'd got photophs of Jack and Mrs. Jones, cut their heads and pasted them over heads on the group, took a little oring of some kind and touched up edges around the patch so they uldn't show, and then put this ked-up affair before the camera l made a new negative. Nobody an expert could do it, but this was well done nobody but an expert ıld have detected the fraud. We n't stop, you can bet your life, un- we found out who did it. It was woman. We managed to let her ɔw that we knew, and let it go at t. But Tom Jones never breathed vord of it to his wife."—S. F. Chron-

---

RECIPES.

l Pepper Pickles.

'o pickle bell peppers cut a slit in h pepper and remove the seeds. them soak in strong brine for two 's, then wash in clear water and ff with red cabbage finely chopped seasoned with minced onion and stard seed. For three days in sucsion pour over them boiling spiced egar and then seal up. They are y nice prepared in the same way omitting the stuffing.

serving Small Fruits.

'ry preservi~g cherries this way: er pitting, cover with vinegar and them stand forty-eight hours. in and pack in stone jars, allow- a cupful of sugar to each cupful cherries. Stir every day until ar is dissolved. They are delius with cold meat, or can be used puddings.

o keep cherries solid or whole en canned, pit them in the even- ; have in readiness any vessel ge enough to hold them. Let ıd until morning and then can or serve them. When opened for they will be as solid as when kled.

n easy way to can strawberries, pberries and red currants, and one which they retain the very best or, is to do them raw. I have e them successfully for three rs and never have lost a jar. The ; must be scrupulously clean and rubbers new; it is false economy try to use old ones. Mash the ries, a few at a time, in a sauce dish, to be sure every one is mashed, using, of course, perfect fruit; then to one cupful of mashed berries add one cupful of sugar. Stir well, fill jars to overflowing and seal. Certainly very simple.

Nut Ice Cream.

Two quarts cream, 1 pint milk, 1½ cups sugar, ½ to ¾ pound chopped black walnuts. Freeze together.

These nuts give the cream a delicious flavor.

HOMELY HINTS.

Odors of Araby.

Sweet clover blooms carefully dried in the shade until well cured, packed loosely in cheesecloth bags, give the linen a faint and dainty perfume that will woo any mortal to pleasant dreams.

Rose Leaves.

Dried rose leaves give to laces a sweet fragrance, and lavender has a clean, refreshing scent. It has been called a brain stimulant. The rose petals should be gathered from fresh —not faded—full-blown flowers while the dew is upon them, as it is a well-known fact that the heat of the sun absorbs much of the fragrance. Dry the petals in a cool, dark room, turning and stirring them frequently. When thoroughly dry they are ready for use, and until wanted keep in tightly closed glass jars. The flowers of lavender are stripped from their slender stalks and dried in the same way. The fragrance of dried tips of mignonette is as soothing to nervous people as far-off music.

For the popular satchet bags a most delightful filling is composed of dried rose leaves, half a pound; dried lavender flowers, quarter of a pound; an equal quantity of mignonette tips; and half as much sweet basil, which has a clove-like fragrance.

Sweetness and Light.

Rose geranium and lemon verbena leaves, tips of rosemary, fennel, sweet fern and lemon thyme are all used singly or in company to create goodly scents. Pillows or little bags filled with these aromatics are very grateful to invalids. The odor, half balsamic and always suggestive of "sweetness and light," acts as a tonic.

Tips of camphor laurel, mint, sweet basil, sage, sassafras, rue and wormwood, well dried and packed in thin cheesecloth bags, will perfume woolens and act as a preventive of moths. The dried leaves may be scattered freely among furs or ground into fine powder and rubbed on the edges of carpets. The perfume they throw off smells much like sandal wood.

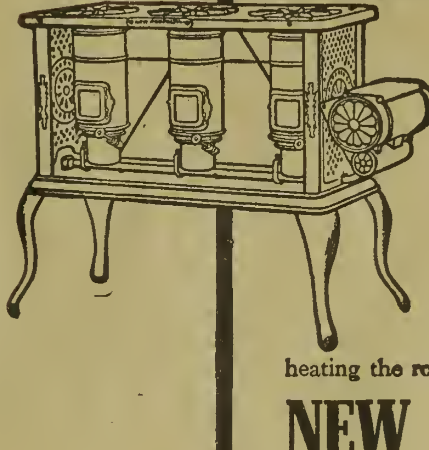
Launder White Waists.

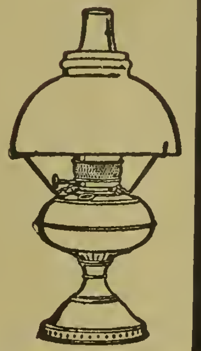
After washing and drying, apply boiled starch, and hang until very dry. When ready to iron, wring out in hot water and put through a wringer. This prevents their shrinking and they will look sheer and fine.

Cleaning Gloves.

To clean suede gloves put them on the hands and then rub them well with fuller's earth applied with a small brush. An old toothbrush or nailbrush will do very well. Some people prefer a mixture of fuller's earth and alum in equal parts to fuller's earth alone.

When taking clothes off the line fold smoothly the wash cloths, bath towels and hose and lay them away without ironing. They are just as good for use as though they were ironed, and the farmer's wife needs to save her time and strength whenever possible.





Have You a Summer Stove?

The stifling air of a close kitchen is changed to comfortable coolness by installing a New Perfection Wick Blue Flame Oil Cook-Stove to do the family cooking.

No kitchen furnishing is so convenient as this stove. Gives a working heat at once, and maintains it until turned out—that too, without overheating the room. If you examine the

NEW PERFECTION
Wick Blue Flame Oil Cook-Stove

you will see why this is so. The heat from the chimney of the "New Perfection" is concentrated under the kettle and not dissipated through the room by radiation. Thus it does the work of the coal range without its discomfort. Ask your dealer about this stove—if not with him, write our nearest agency.

The Rayo Lamp is a very handsome piece of housefurnishing and gives a clear, powerful light more agreeable than gas or electricity. Safe everywhere and always. Made of brass finely nickel plated—just the thing for the living-room. If not with your dealer, write our nearest agency.

Standard Oil Company
(Incorporated)

$16.30 buys this handsome six-hole Nickle-Trimmed Cast Range direct from the Manufacturer

without high shelf. With high shelf, just as shown in the cut, $19.97; large oven, six cooking holes, best quality of iron. Burns coal or wood. Handsome nickel trimmings. OUR TERMS are the most liberal ever made. You can pay after you receive the range. You can take it into your own home and use it 30 days. If you don't find it exactly as represented, the biggest bargain you ever saw, you won't have to keep it.

Write today for our beautifully illustrated Stove Catalogue No. 101-C. A postal card will do it. Don't buy until you get it.

WHY DON'T YOU RIDE IN AN AUTOMOBILE?

In the past few years the automobile has been perfected until now it is almost a perfect piece of mechanism. Then again, the price has been greatly reduced until it is within the reach of almost all, but those who feel that they want a machine for their own use and will use their time for soliciting orders for machines in their immediate neighborhood can make money, and will find it to their advantage to write to the A. W. Gump Company, 1118 South Main Street, Los Angeles, California, who have an advertisement in this issue. This company sells one of the best automobiles made and are very anxious to secure good agents in this State where they are not now represented. The Gump Company handle the Jackson line which comprises four styles of cars ranging in price from $900 up. If you are interested and will write them asking for a catalogue and particulars, you will learn how you can make part of the purchase price of this machine by interesting your neighbors in the same.

For Mehring Foot-Power Milking Machines see O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles, Cal.

Hay.

Somers & Co. seem to take a b view of the hay situation, but t farmers are quietly holding, and worrying. Somers and Co. say:

Shipments of hay for the week ending show some increase over t week preceding, the total being tons in comparison with 2650. The market is decidedly unintere from all view points, for trade quiet and neither consumers or d ers seem to have any encouragem to go out and buy new crop h Some new hay is being market right along, but as so little interest shown, there seems to be no esta lished basis on any variety now ar riving and as receivers here diff widely in their ideas it is impossib to quote the market on new crop w any degree of satisfaction. Farme for the most part are holding at rat er extreme figures, which we do n think will be realized this seaso Although the outlook for general trading is far from being discourag yet there is nothing in the imm diate future to give any one particu confidence, so we must naturally f that conservatism in both buying a selling hay should be practiced. Bu ness must be better at some time, b we incline to the idea that trade be quiet for the balance of 1908 least.

Citrus Market

LOS ANGELES, June 24, 1

Oranges are sadly in the du Immense supplies of small fruits tropicals have satisfied the Ea market so that demands for orang have been very light. Shipments being rapidly reduced which wi doubtless, correct the situation.. Sh ments now run between 30 and 40 car per day.

Lemons, on the other hand, are be ing received with favor. The extreme heat has stimulated the demand till the market is kept clean, notwithstanding the heavy importations of foreigns.

hipments.

Shipments of citrus fruits for the ear aggregate 25,391 cars, of which 44 were lemons. Last year same ate 23,791, of which 2340 were lemons.

NEW YORK, June 22.—One car na- els, one mixed, one seedlings, seven alencias, three St. Michaels, four veets and one lemon sold. Market ontinues very much depressed; lower ı all varieties, due to heavy receipts fresh fruit.

A True Plane

When you buy an ordinary plane you have to find out by actual use whether it is true or not.

You know a Keen Kutter Plane, or any Keen Kutter tool, is true before you buy it, because it is stamped with the trademark which guarantees it.

You know it will be perfect in hang, balance, temper, finish and adjustment, because all Keen Kutter Tools are tested and inspected and found worthy to uphold their well-earned reputation as Tools of Service before the name and trademark are stamped upon them. This mark is your safeguard in buying tools. It costs you nothing, but means if anything goes wrong you shall not be the loser. To be sure of lasting, accurate, and practical tools, ask for

KEEN KUTTER
Tools and Cutlery

The name Keen Kutter covers Saws, Chisels, Bits, Drills, Gimlets, Awls, Planes, Hammers, Hatchets, Axes, Drawing-knives, Screw-drivers, Files, Pliers, Glass cutters, Ice-picks, and a full line of Farm and Garden Tools—Forks, Hoes, Scythes, Trowels, Manure-hooks, Lawn-mowers, Grass-shears, Rakes, etc. Also a full line of Scissors and Shears, Pocket-knives and Table Cutlery.

Keen Kutter Tools have been sold for nearly 40 years under this mark and motto:

"The Recollection of Quality Remains Long After the Price is Forgotten."—E. C. Simmons. Trademark Registered.

MENACE TO INDUSTRY.

Continued from page 691.

With tobacco and potash we brought every thrips out, and when they came througn the clusters we killed all of them. While the tree is in full bloom you can spray it without injury to the fruit."

Government Should Aid.

Mr. Whitman spoke of the seriousness of the situation comparing his trees with a neighbors:

"While my pears were blossoming I could find as many thrips in mine as were on his trees. I have been think- think that when the crop is completely destroyed this year possibly the bud will be stronger in succeeding years. Pear thrips, to my mind, is the most serious menace there is to orchardists.

Our university and federal government are spending a good many dollars on the pear blight, which is not as serious as this thrips' matter. This means the destruction of the pear industry of California which the blight does not."

Before the meeting closed the president of the Board was requested to appeal direct to Secretary Wilson for aid, as was noted on editorial page of last week's Cultivator.

Mr. Moulton was thanked for his attendance, and the hope expressed that the Department would send an additional force to help solve this serious problem.

A NEW IMPERIAL.

An event to take place within the next few months that will prove of the utmost importance and interest to the farmers and homeseekers throughout the United States and Canada, is the opening up for settlers of the valley of the Yaqui river.

This valley lies on the eastern coast of the Gulf of Lower California, about 275 miles south of the boundary line of the United States, and is on the Yaqui river division of the Southern Pacific Railway. The soil and climatic conditions are almost identical with those of the now world famous Imperial valley.

The work of taking the water out of the Yaqui river and distributing it over the 550,000 acres of land that comprise this valley is being rapidly pushed to completion and the owners expect to be able to offer the land to small investors late in the fall or early winter.

Owing to the fact that a great many thousand dollars are needed to complete these developments, it has been decided to offer a few thousand acres in large tracts of not less than 1000 acres each, at a price that will attract both speculators and the more conservative investors. It will be possible for the next 60 days, to buy 1000 acres at $12.50 per acre, and this price will include a permanent water right entitling the owner to use such water as he may require, at the rate of 50 cents per acre foot. O. A. Vickrey & Company, 308 South Hill street, have been appointed sole selling agents. Any further information may be obtained at their offices.

BIRDSELL.

"Birdsell" has long been a synonym for perfection in alfalfa and clover hullers. The Birdsell Manufacturing Co. of South Bend, Indiana, is the original manufacturer of the clover huller. Through a period of many years that company has continually raised the standard till now practical perfection is reached. A catalogue has just been issued profusely illustrated. Any one interested in such machines should write at once to the Birdsell people and ask for this booklet.
